Trinidad And Tobago
Multiple Indicator Cluster Survey 2022

Survey Findings Report
December, 2023

Government of the Republic of Trinidad and Tobago
MINISTRY OF PLANNING AND DEVELOPMENT

The Trinidad and Tobago Multiple Indicator Cluster Survey (MICS) was carried out from August to December 2022 by the Central Statistical Office in collaboration with UNICEF, as part of the Global MICS Programme. Technical support was provided by the United Nations Children’s Fund (UNICEF), with government funding and financial support of UNICEF.

The Global MICS Programme was developed by UNICEF in the 1990s as an international multi-purpose household survey programme to support countries in collecting internationally comparable data on a wide range of indicators on the situation of children and women. MICS surveys measure key indicators that allow countries to generate data for use in policies, programmes, and national development plans, and to monitor progress towards the Sustainable Development Goals (SDGs) and other internationally agreed upon commitments. In this regard, Trinidad and Tobago has aligned its National Development Strategy 2016-2030, also known as Vision 2030, with the SDGs, so that progress towards one redounds to the other.

The objective of this report is to facilitate the timely dissemination and use of results from the Trinidad and Tobago MICS. The report contains detailed information on the survey methodology, and all standard MICS tables. The report is accompanied by a series of Statistical Snapshots of the main findings of the survey.

For more information on the Global MICS Programme, please go to mics.unicef.org.

Summary Table of Survey Implementation and The Survey Population

Survey sample and implementation			
Sample frame - Updated	2011 Population and Housing Census February to August 2019	Questionnaires	Household Women (age 15-49) Children under five Children age 5-17 Water Quality Testing
Interviewer training	June to July 2022	Fieldwork	August to December 2022
Survey sample			
Households - Sampled - Occupied - Interviewed - Response rate (Per cent)	8,969 8,181 7,499 91.7	Water Quality Testing - Sampled - Occupied - Response rate (Per cent) - Household - Source	2,249 2,063 90.1 78.0
Women (age 15-49) - Eligible for interviews - Interviewed - Response rate (Per cent)	5,895 5,523 93.7	Children under five - Eligible - Mothers/caretakers interviewed - Response rate (Per cent)	1,730 1,656 95.7
		Children age 5-17 - Number in interviewed households - Eligible - Mothers/caretakers interviewed - Response rate (Per cent)	5,730 3,251 3,131 96.3

Survey population			
Average household size	2.9	Percentage of population living in	
		- Urban areas	59.8
		- Rural areas	40.2
Percentage of population under:		- North-West RHA	20.4
- Age 5	4.5	- North-Central RHA	26.7
- Age 18	22.0	- Eastern RHA	8.5
		- South-West RHA	39.7
		- Tobago RHA	4.6
Percentage of women age 15-49 years with at least one live birth in the last 2 years	7.3

Acknowledgements

The Central Statistical Office (CSO), a division of the Ministry of Planning and Development wishes to extend its deepest appreciation to the people of the Republic of Trinidad and Tobago who welcomed into their homes our field data collection teams during the conduct of the Multiple Indicator Cluster Survey. The assistance and support received from household members was instrumental in making the survey an unqualified success. The data received from the MICS will provide invaluable insight and progress made on the socio-economic status of women and children.

The staff of the Census and Surveys Unit of the CSO must be commended for their dedication and effort in undertaking this survey. They worked tirelessly to ensure the completion of the survey on a timely basis. The support and advocacy of the Honourable Camille Robinson – Regis and the Honourable Penelope Buckles are acknowledged. The CSO also wished to thank the former Permanent Secretary Ms. Joanne Deoraj whose direct interest ensured that the MICS project was adequately resourced and efficiently administered.

The field staff (survey coordinator, supervisor, measurers and interviewers), who undertook the arduous task of collecting the necessary data via a very interactive and involved process, must be highly commended for their professionalism and commitment.

The MICS was undertaken in close collaboration with the United Nations Children’s Fund (UNICEF). UNICEF provided

expert technical assistance, guidance and financial support for all phases of the survey. The CSO expresses its sincere appreciation to the UNICEF MICS team who worked closely with the CSO staff on this project. The CSO is indebted to the Dr. Aloys Kamuragiye, Mr. Alexandru Nartea, Mr. Patrice Bosso, Ms. Stephanie Bishop, Mr. Harry Hernandez, Mr. Armando Levinson, Mr. Jose Sierra Castillo and many other members of the UNICEF team.

However, a very special than you must be directed towards the International MICS consultants: Ms. Jacqueline Small and Ms. Denise Buchner who collaborated with the CSO, almost on a daily basis, during the conduct of the survey. They both demonstrated a very high level of interest, commitment and technical expertise in guiding the MICS project from start to finish.

Finally, the CSO expresses its gratitude to the following:

- i. the principals and students of Nelson Street Boys’ R.C. School and Nelson Street Girl’s R.C. School for facilitating our practice sessions during the training;
- ii. Ministries of government that provided tremendous support via their staff; and
- iii. Stakeholders of the National Statistical System that took the time and effort to attend the review sessions concerning the tables that form part of this report.

Introduction

1 Introduction

This report is based on the Trinidad and Tobago Multiple Indicator Cluster Survey (MICS), conducted in 2022 by the Central Statistical Office. The survey provides statistically sound and internationally comparable data essential for developing evidence-based policies and programmes, and for monitoring progress toward national goals and global commitments.

A Commitment to Action: National and International Reporting Responsibilities

More than two decades ago, the **Plan of Action for Implementing the World Declaration on the Survival, Protection and Development of Children in the 1990s** called for:

“Each country should establish appropriate mechanisms for the regular and timely collection, analysis and publication of data required to monitor relevant social indicators relating to the well-being of children Indicators of human development should be periodically reviewed by national leaders and decision makers, as is currently done with indicators of economic development...”

The Multiple Indicator Cluster Surveys programme was developed soon after, in the mid-1990s, to support countries in this endeavour.

Governments that signed the **World Fit for Children Declaration and Plan of Action** also committed themselves to monitoring progress towards the goals and objectives:

“We will monitor regularly at the national level and, where appropriate, at the regional level and assess progress towards the goals and targets of the present Plan of Action at the national, regional and global levels. Accordingly, we will strengthen our national statistical capacity to collect, analyse and disaggregate data, including by sex, age and other relevant factors that may lead to disparities, and support a wide range of child-focused research” (A World Fit for Children, paragraph 60)

Similarly, the **Millennium Declaration** (paragraph 31) called for periodic reporting on progress:

“...We request the General Assembly to review on a regular basis the progress made in implementing the provisions of this Declaration, and ask the Secretary-General to issue periodic reports for consideration by the General Assembly and as a basis for further action.”

The General Assembly Resolution, adopted on 25 September 2015, “**Transforming Our World: the 2030 Agenda for Sustainable Development**” stipulates that for the success of the universal SDG agenda,

“quality, accessible, timely and reliable disaggregated data will be needed to help with the measurement of progress and to ensure that no one is left behind” (paragraph 48); recognizes that “...baseline data for several of the targets remains unavailable...” and calls for “...strengthening data collection and capacity building in Member States...”

The Government of Trinidad and Tobago has made a concerted effort to ensure the integration of the SDGs into the national planning, budgetary and development financing processes¹. Using Vision 2030, which is SDG-aligned at the thematic and goal levels, a decision was made to align all national and sector level policies

1. Voluntary National Review Trinidad and Tobago Connecting the Dots to the SDG's 2020.

to the relevant SDGs. The government reviewed all 17 SDGs and aligned them to the 56 short, medium and long term national goals while developing Vision 2030. This integrated approach means that achieving the Vision 2030 goals will simultaneously drive the progress on the SDGs, while still maintaining the necessary focus on Trinidad and Tobago's developmental needs. This MICS is seen as an important tool for measuring progress towards key national and international targets as laid out in the various development plans. The disaggregated data collected by the MICS will identify inequalities and disparities that will help monitor Trinidad and Tobago's progress in achieving both the SDGs and Vision 2030, since the MICS survey produces information on 43 global SDG indicators, either in their entirety or partially.

The 2022 MICS has as its primary objectives:

- To provide high quality data for assessing the situation of children, adolescents, women and households in Trinidad and Tobago;
- To furnish data needed for monitoring progress toward national goals, as a basis for future action;
- To collect disaggregated data for the

identification of disparities, to inform policies aimed at social inclusion of the most vulnerable;

- To validate data from other sources and the results of focused interventions;
- To generate data on national and global SDG indicators;
- To generate internationally comparable data for the assessment of the progress made in various areas, and to put additional efforts in those areas that require more attention;
- To generate behavioural and attitudinal data not available in other data sources.

This report presents the results of the Trinidad and Tobago 2022 MICS. Following Chapter 2 on survey organisation and methodology, including sample design and implementation, all indicators covered by the survey, with their definitions, are presented in "Indicators and definitions". Prior to presenting the survey results, organized into thematic chapters, the coverage of the sample and the main characteristics of respondents is covered in Chapter 4, "Sample coverage and characteristics of respondents". From Chapter 5, all survey results are presented in seven thematic chapters. In each

chapter, a brief introduction of the topic and the description of all tables, are followed by the tabulations.

Chapter 5, “Survive”, includes findings on under-5 mortality.

This is followed by Chapter 6, “Thrive – Reproductive and maternal health”, which presents findings on fertility, early childbearing, contraception, unmet need, antenatal care, neonatal tetanus, delivery care, birthweight, and post-natal care, adult and maternal mortality, and HIV, and ends with male circumcision.

The following chapter, “Thrive – Child health, nutrition and development” presents findings on immunisation, disease episodes, diarrhoea, household energy use, symptoms of acute respiratory infection, malaria, infant and young child feeding, malnutrition, salt iodisation, and early childhood development.

Learning is the topic of the next chapter, where survey findings on early childhood education, educational attendance, paternal involvement in children’s education, and foundational learning skills are covered.

The next chapter, “Protected from violence and exploitation”, includes survey results on birth registration, child discipline, child labour, child marriage, female genital mutilation, victimisation, feelings of safety, and attitudes toward domestic violence.

Chapter 10, “Live In a safe and clean environment”, covers the topics of drinking water, handwashing, sanitation, and menstrual hygiene.

The final thematic chapter is on equity – titled “Equitable chance in life”, the chapter presents findings on a range of equity related topics, including child functioning, social transfers, discrimination and harassment, and subjective well-being.

The report ends with appendices, with detailed information on sample design, personnel involved in the survey, estimates of sampling errors, data quality, and the questionnaires used.

Survey Organisation and Methodology

2 Survey Organisation and Methodology

2.1

SURVEY ORGANISATION

The Trinidad and Tobago MICS 2022 was implemented by the Census and Surveys Unit of the Central Statistical Office (CSO). Oversight was provided by a Steering Committee and technical decisions and processes were guided and supported by the MICS team of the Census and Surveys Unit² The Global MICS Team of UNICEF provided on and off-site support and reviews during key phases of the survey as per the standard Technical Collaboration Framework of the global MICS programme and the Memorandum of Understanding between the Government of the Republic of Trinidad and Tobago and UNICEF.

2.2

SAMPLE DESIGN

The sample for the Trinidad and Tobago MICS 2022 was designed to provide estimates for a large number of indicators on the situation of children and women

at the national level, for urban and rural areas, and for 5 regional health authorities. The urban and rural areas within each region were identified as the main sampling strata and the sample of households was selected in two stages. Within each stratum, a specified number of census enumeration districts (EDs) were selected systematically with probability proportional to size. After a household listing was carried out within the selected EDs, a systematic sample of twenty (20) households was drawn in each sample enumeration district (ED). In total, a sample of 9,000 households were drawn from 450 EDs. Only one (1) of the selected enumeration districts was not visited because of safety concerns during the fieldwork period. As the sample is not self-weighting, sample weights are used for reporting survey results. A more detailed description of the sample design can be found in Appendix A: Sample Design.

2.3

QUESTIONNAIRES

Five questionnaires were used in the survey: 1) a household questionnaire to collect basic demographic information on all de jure household members (usual residents), the household, and the dwelling; 2) a water quality testing questionnaire administered in five (5)

2. Membership of the MICS Team of the Census and Surveys Unit and the Steering Committee are listed in Appendix B.

households in each cluster of the sample; 3) a questionnaire for individual women administered in each household to all women age 15-49 years; 4) an under-5 questionnaire, administered to mothers (or caretakers) of all children under 5 living in the household; and 5) a questionnaire for children age 5-17 years, administered to the mother (or caretaker) of one randomly selected child age 5-17 years living in the household.³ The questionnaires included the following modules:

<p style="text-align: center;">Household Questionnaire</p> <p>List of Household Members Education Household Characteristics Social Transfers Household Energy Use Water and Sanitation Handwashing MICS Plus Consent</p>	<p style="text-align: center;">Questionnaire for Individual Women</p> <p>Woman's Background Mass Media and ICT Fertility / Birth History Desire for Last Birth Maternal and Newborn Health Contraception Unmet Need Victimisation Marriage/Union Sexual Behaviour HIV/AIDS Tobacco and Alcohol Use Sexual Behaviour HIV/AIDS Life Satisfaction MICS Plus Consent</p>	<p style="text-align: center;">Questionnaire for Children Age 5-17 Years</p> <p>Child's Background Child Labour Child Discipline Child Functioning Parental Involvement Foundational Learning Skills</p>
<p style="text-align: center;">Water Quality Testing Questionnaire</p>		<p style="text-align: center;">Questionnaire for Children Under 5</p> <p>Under-Five's Background Birth Registration Early Childhood Development Child Discipline Child Functioning Breastfeeding and Dietary Intake Immunisation Care of Illness</p>

In addition to the administration of questionnaires⁴, fieldwork teams observed the place for handwashing and tested household and source water for E. coli levels. Details and findings of these observations and measurements are provided in the respective sections of the report. Further, the questionnaire for children age 5-17 years

3. Children age 15-17 years living without their mother and with no identified caretaker in the household were considered emancipated and the questionnaire for children age 5-17 years was administered directly to them. This slightly reworded questionnaire that only includes the Child's Background, Child Labour and Child Functioning modules is not reproduced in Appendix E.

4. <http://mics.unicef.org/tools#survey-design>

included a reading and mathematics assessment administered to children age 7-14 years.

The questionnaires were based on the MICS6 standard questionnaires. The MICS6 model English, questionnaires were customised and were pre-tested in the communities of Barataria, St. James, Cumuto and Liberville in Trinidad during the period May 31st to June 10th 2019. Based on the results of the pre-test, modifications were made to the wording of the questionnaires. A copy of the Trinidad and Tobago MICS 2022 questionnaires is provided in Appendix E..

2.4 ETHICAL PROTOCOL

The survey protocol was approved by the Ministry of Health Ethics Committee in 2019. The protocol included a Protection Protocol which outlines the potential risks during the life cycle of the survey and management strategies to mitigate these.

Verbal consent was obtained for each respondent participating and, for children age 15-17 years individually interviewed, parental/adult consent was obtained in advance of the child's assent. All respondents were informed of the voluntary nature of participation and the confidentiality and anonymity of information. Additionally, respondents were informed of their right to refuse answering all or

particular questions, as well as to stop the interview at any time.

2.5 DATA COLLECTION METHOD

MICS surveys utilise Computer-Assisted Personal Interviewing (CAPI). The data collection application was based on the CSPro (Census and Survey Processing System) software, Version 6.3, including a MICS dedicated data management platform. Procedures and standard programs⁵ developed under the global MICS programme were adapted to the Trinidad and Tobago MICS 2022 final questionnaires and used throughout. The CAPI application was tested in in the communities of Arima, Embacadere, Cunupia and Penal in Trinidad during the period September 17th to 23rd 2019. Based on the results of the CAPI-test, modifications were made to the questionnaires and application.

2.6 TRAINING

Training for the fieldwork was conducted for twenty four days from June 27th to July 28th 2022. Training included lectures on interviewing techniques and the contents of the questionnaires, and mock interviews between trainees to gain practice in asking questions. Participants first completed full training

5. <http://mics.unicef.org/tools#data-processing>

on paper questionnaires, followed by training on the CAPI application. The trainees spent two (2) days in field practice and one day on a full pilot survey in the communities of Blue Basin, Curepe, Tunapuna, Jerningham Junction, Cocoyea Village, Charlieville, St. Joseph Village, Aranguéz and El Socorro. The training agenda was based on the template MICS6 training agenda.⁶

Measurers received dedicated training in water quality testing for a total of five (5) days, including three (3) days in field practice and pilot survey.

Field Supervisors attended additional training on the duties of team supervision and responsibilities.

2.7 FIELDWORK

The data were collected by ten (10) teams; each was comprised of between two to four interviewers, one measurer and a supervisor. Fieldwork began on August 1st 2022 and concluded on December 10th 2022.

Data was collected using tablet computers running the Windows 10 operating system, utilising a Bluetooth application for field operations, enabling

transfer of assignments and completed questionnaires between supervisor and interviewer tablets.

2.8 FIELDWORK QUALITY CONTROL MEASURES

Team supervisors were responsible for the daily monitoring of fieldwork. Mandatory re-interviewing was implemented on one household per cluster. Daily observations of interviewer skills and performance was conducted.

During the fieldwork period, each team was visited multiple times by survey management team members and field visits were arranged for UNICEF MICS Team members.

Throughout the fieldwork, field check tables (FCTs) were produced weekly for analysis and action with field teams. The FCTs were customised versions of the standard tables produced by the MICS Programme.⁷

2.9 DATA MANAGEMENT AND EDITING

Data were received at the CSO's central office via

6. <http://mics.unicef.org/tools#survey-design>

7. <http://mics.unicef.org/tools#data-collection>

Internet File Streaming System (IFSS) integrated into the management application on the supervisors' tablets. Whenever logistically possible, synchronisation was daily. The central office communicated application updates to field teams through this system.

During data collection and following the completion of fieldwork, data were edited according to editing process described in detail in the Data Editing Guidelines, a customised version of the standard MICS6 documentation.⁸

2.10 ANALYSIS AND REPORTING

Sample weights and background characteristics were computed and added to the final data. Analysis was done using the Statistical Package for Social Sciences (SPSS) software, Version 24. Model syntax and tabulation plan developed by UNICEF were customised and used for this purpose.⁹

The tables for the Survey Findings Report and accompanying Statistical Snapshots were drafted

based on the templates developed by the global MICS Programme¹⁰. These were presented and reviewed by subject matter experts during the Stakeholder Data Interpretation Workshop held at the CSO's Plaza 47 on April 20th and 21st 2023. The finalisation of the Survey Findings Report and Statistical Snapshots was managed by the Survey Management Team with guidance from the Steering Committee and the participants in the Stakeholder Data Interpretation Workshop.

2.11 DATA SHARING

Unique identifiers such as location and personal details collected during interviews were removed from datasets to ensure privacy. These anonymised data files are made available on www.cso.gov.tt and on the MICS website¹¹ and can be freely downloaded for legitimate research purposes. Users are required to submit final research to entities listed in the included readme file, strictly for information purposes.

Indicators and Definitions

3 Indicators and Definitions

MICS INDICATOR		SDG ¹²	Module ¹³	Definition ¹⁴	Value
SAMPLE COVERAGE AND CHARACTERISTICS OF THE RESPONDENTS					
SR.1	Access to electricity	7.1.1	HC	Percentage of household members with access to electricity	98.2
SR.2	Literacy rate (age 15-24 years)		WB	Percentage of women age 15-24 years who are able to read a short simple statement about everyday life or who attended secondary or higher education	99.5
SR.3	Exposure to mass media		MT	Percentage of women age 15-49 years who, at least once a week, read a newspaper or magazine, listen to the radio, and watch television	88.2
SR.4	Households with a radio		HC	Percentage of households that have a radio	65.5
SR.5	Households with a television		HC	Percentage of households that have a television	91.9

12. Sustainable Development Goal (SDG) Indicators, <http://unstats.un.org/sdgs/indicators/indicators-list/>. The Inter-agency Working Group on SDG Indicators is continuously updating the metadata of many SDG indicators and changes are being made to the list of SDG indicators. MICS covers many SDG indicators with an exact match of their definitions, while some indicators are only partially covered by MICS. The latter cases are included here as long as the current international methodology allows for only the way that the MICS indicator is defined, and/or a significant part of the SDG indicator can be generated by the MICS indicator. For more information on the metadata of the SDG indicators, see <http://unstats.un.org/sdgs/metadata/>

13. Some indicators are constructed by using questions in several modules in the MICS questionnaires. In such cases, only the module(s) which contains most of the necessary information is indicated.

14. All MICS indicators are or can be disaggregated, where relevant, by wealth quintiles, sex, age, ethnicity, migratory status, disability and geographic location (as per the reporting domains), or other characteristics, as recommended by the Inter-agency Expert Group on SDG Indicators: <http://unstats.un.org/sdgs/indicators/Official%20List%20of%20Proposed%20SDG%20Indicators.pdf>

SR.6	Households with a telephone		HC – MT	Percentage of households that have a telephone (fixed line or mobile phone)	97.1
SR.7	Households with a computer		HC	Percentage of households that have a computer	61.0
SR.8	Households with internet		HC	Percentage of households that have access to the internet by any device from home	83.5
SR.9	Use of computer		MT	Percentage of women age 15-49 years who used a computer during the last 3 months	65.8
SR.10	Ownership of mobile phone	5.b.1	MT	Percentage of women age 15-49 years who own a mobile phone	95.3
SR.11	Use of mobile phone		MT	Percentage of women age 15-49 years who used a mobile telephone during the last 3 months	97.3
SR.12a	Use of internet	17.8.1	MT	Percentage of women age 15-49 years who used the internet	
SR.12b				(a) during the last 3 months	93.3
				(b) at least once a week during the last 3 months	91.8

SR.13a SR.13b	ICT skills	4.4.1	MT	Percentage of women who have carried out at least one of nine specific computer related activities during the last 3 months (a) age 15-24 (b) age 15-49	65.0 57.8
SR.14a	Use of tobacco	3.a.1	TA	Percentage of women age 15-49 years who smoked cigarettes or used smoked or smokeless tobacco products at any time during the last one month	8.0
SR.14b	Non-smokers	3.8.1	TA	Percentage of women age 15-49 years who did not smoke cigarettes or any other smoked tobacco product during the last one month	91.2
SR.15	Smoking before age 15		TA	Percentage of women age 15-49 years who smoked a whole cigarette before age 15	2.7
SR.16	Use of alcohol		TA	Percentage of women age 15-49 years who had at least one alcoholic drink at any time during the last one month	42.1
SR.17	Use of alcohol before age 15		TA	Percentage of women age 15-49 years who had at least one alcoholic drink before age 15	7.3
SR.18	Children's living arrangements		HL	Percentage of children age 0-17 years living with neither biological parent	6.1

SR.19	Prevalence of children with one or both parents dead		HL	Percentage of children age 0-17 years with one or both biological parents dead	7.1
SR.20	Children with at least one parent living abroad		HL	Percentage of children age 0-17 years with at least one biological parent living abroad	2.6

TC.30	Children ever breastfed		MN	Percentage of most recent live-born children to women with a live birth in the last 2 years who were ever breastfed	95.6

21. Household members living in households that report no cooking, no space heating, or no lighting are not excluded from the numerator

MICS INDICATOR		SDG ¹²	Module ¹³	Description ¹⁴	Value
TC.31	Early initiation of breastfeeding		MN	Percentage of most recent live-born children to women with a live birth in the last 2 years who were put to the breast within one hour of birth	48.3
TC.32	Exclusive breastfeeding under 6 months		BD	Percentage of infants under 6 months of age who are exclusively breastfed ²²	30.5
TC.33	Predominant breastfeeding under 6 months		BD	Percentage of infants under 6 months of age who received breast milk as the predominant source of nourishment ²³ during the previous day	42.8
TC.34	Continued breastfeeding at 1 year		BD	Percentage of children age 12-15 months who received breast milk during the previous day	44.6
TC.35	Continued breastfeeding at 2 years		BD	Percentage of children age 20-23 months who received breast milk during the previous day	34.9
TC.36	Duration of breastfeeding		BD	The age in months when 50 percent of children age 0-35 months did not receive breast milk during the previous day	11.7

22. Infants receiving breast milk, and not receiving any other fluids or foods, with the exception of oral rehydration solution, vitamins, mineral supplements and medicines

23. Infants who receive breast milk and certain fluids (water and water-based drinks, fruit juice, ritual fluids, oral rehydration solution, drops, vitamins, minerals, and medicines), but do not receive anything else (in particular, non-human milk and food-based fluids)

MICS INDICATOR		SDG ¹²	Module ¹³	Description ¹⁴	Value
TC.37	Age-appropriate breastfeeding		BD	Percentage of children age 0-23 months appropriately fed ²⁴ during the previous day	40.6
TC.38	Introduction of solid, semi-solid or soft foods		BD	Percentage of infants age 6-8 months who received solid, semi-solid or soft foods during the previous day	75.6
TC.39a	Minimum acceptable diet		BD	Percentage of children age 6–23 months who had at least the minimum dietary diversity and the minimum meal frequency during the previous day	
TC.39b				(a) breastfed children	36.5
				(b) non-breastfed children	38.2
TC.40	Milk feeding frequency for non-breastfed children		BD	Percentage of non-breastfed children age 6-23 months who received at least 2 milk feedings during the previous day	94.0
TC.41	Minimum dietary diversity		BD	Percentage of children age 6–23 months who received foods from 5 or more food groups ²⁵ during the previous day	45.5

24. Infants age 0-5 months who are exclusively breastfed, and children age 6-23 months who are breastfed and ate solid, semi-solid or soft foods

25. The indicator is based on consumption of any amount of food from at least 5 out of the 8 following food groups: 1) breastmilk, 2) grains, roots and tubers, 3) legumes and nuts, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry and liver/organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables

MICS INDICATOR		SDG ¹²	Module ¹³	Description ¹⁴	Value
TC.42	Minimum meal frequency		BD	Percentage of children age 6-23 months who received solid, semi-solid and soft foods (plus milk feeds for non-breastfed children) the minimum number of times ²⁶ or more during the previous day	76.1
TC.43	Bottle feeding		BD	Percentage of children age 0-23 months who were fed with a bottle during the previous day	79.7
TC.49a	Early stimulation and responsive care		EC	Percentage of children age 24-59 months engaged in four or more activities to provide early stimulation and responsive care in the last 3 days with	86.3
TC.49b				(a) Any adult household member	
TC.49c				(b) Father	
				(c) Mother	73.4
TC.50	Availability of children's books		EC	Percentage of children under age 5 who have three or more children's books	65.0
TC.51	Availability of playthings		EC	Percentage of children under age 5 who play with two or more types of playthings	84.0
TC.52	Inadequate supervision		EC	Percentage of children under age 5 left alone or under the supervision of another child younger than 10 years of age for more than one hour at least once in the last week	1.9

26. Breastfeeding children: Solid, semi-solid, or soft foods, two times for infants age 6-8 months, and three times for children 9-23 months; Non-breastfeeding children: Solid, semi-solid, or soft foods, or milk feeds, four times for children age 6-23 months

4 Sample Coverage And Characteristics Of Respondents

4 Sample Coverage and Characteristics of Respondents

4.1

RESULTS OF INTERVIEWS

Table SR.1.1 presents results of the sample implementation, including response rates. Of the 8,969 households selected for the sample, 8,181 were found occupied. Of these, 7,499 were successfully interviewed for a household response rate of 91.7 percent.

The Water Quality Testing Questionnaire was administered to five randomly selected households in each cluster. Of these, 1,858 were successfully tested for household drinking water yielding a response rate of 90.1 percent. Also, 1,609 were successfully tested for source drinking water quality yielding a response rate of 78.0 percent.

In the interviewed households, 5,895 women (age 15-49 years) were identified. Of these, 5,523 were successfully interviewed, yielding a response rate of 93.7 percent within the interviewed households.

There were 1,730 children under age five listed in the household questionnaires. Questionnaires were completed for 1,656 of these children, which corresponds to a response rate of 95.7 percent within interviewed households.

A sub-sample of children age 5-17 years was used to administer the questionnaire for children age 5-17. Only one child has been selected randomly in each household interviewed, and there were 5,730 children age 5-17 years listed in the household questionnaires. Of these, 3,251 children were selected, and questionnaires were completed for 3,131 which corresponds to a response rate of 96.3 percent within the interviewed households.

Overall response rates of 85.9 percent, 87.7 percent, and 88.3 percent are calculated for the individual interviews of women, under-5s, and children age 5-17 years, respectively.

Table SR.1.1: Results of household, household water quality testing, women's, under-5's and children age 5-17's interviews

The response rate within completed households is presented in Table DQ.3.2.^CThe Questionnaire for Children Age 5-17 was administered to one randomly selected child in each interviewed household

4.2 HOUSING AND HOUSEHOLD CHARACTERISTICS

Tables SR.2.1, SR.2.2 and SR.2.3 provide further details on household level characteristics obtained in the Household Questionnaire. Most of the information collected on these housing characteristics have been used in the construction of the wealth index.

Table SR.2.1 presents characteristics of housing, disaggregated by area and region, distributed by whether the dwelling has electricity, energy used for cooking, internet access, the main materials of the flooring, roof, and exterior walls, as well as the number of rooms used for sleeping.

In Table SR.2.2 households are distributed according to ownership of assets by households and by individual household members. This also includes ownership of dwelling.

Table SR.2.3 shows how the household populations in areas and regions are distributed according to household wealth quintiles.

4.3 HOUSEHOLD COMPOSITION

Tables SR.3.1 provides the distribution of households by selected background characteristics, including the sex of the household head, region, area, number of household members, education of household head, and ethnicity²⁸. Both unweighted and weighted numbers are presented. Such information is essential for the interpretation of findings presented later in the report and provide background information on the representativeness of the survey sample. The remaining tables in this report are presented only with weighted numbers.²⁹

The presented background characteristics are used in subsequent tables in this report; the figures in the table are also intended to show the numbers of observations by major categories of analysis in the report.

The weighted and unweighted total number of households are equal, since sample weights were normalized.²⁹ The table also shows the weighted mean household size estimated by the survey.

28. This was determined by asking "To what ethnic group does (name) belong?".

29. See Appendix A: Sample design, for more details on sample weights.

4.4

AGE STRUCTURE OF HOUSEHOLD POPULATION

The weighted age and sex distribution of the survey population is provided in Table SR.4.1. In the households successfully interviewed in the survey, a weighted total of 21,835 household members were listed. Of these, 10,852 were males, and 10,983 were females.³⁰

Table SR.4.1: Age distribution of household population by sex

Percent and frequency distribution of the household population^A in five-year age groups and child (age 0-17 years) and adult populations (age 18 or more), by sex, Trinidad and Tobago, 2022

85+	124	1.1	174	1.6	298	1.4
Child and adult populations						
Children age 0-17 years	2,444	22.5	2,365	21.5	4,809	22.0
Adults age 18+ years	8,408	77.5	8,618	78.5	17,026	78.0

^AAs this table includes all household members listed in interviewed households, the numbers and distributions by sex do not match those found for individuals in tables SR.5.1W/M, SR.5.2 and SR.5.3 where interviewed individuals are weighted with individual sample weights.

30. The single year age distribution is provided in Table DQ.11 in Appendix D: Data quality.

4.5 RESPONDENTS' BACKGROUND CHARACTERISTICS

Tables SR.5.1W, SR.5.2, and SR.5.3 provide information on the background characteristics of female respondents 15-49 years of age, children under age 5 and children age 5-17 years. In all these tables, the total numbers of weighted and unweighted observations are equal, since sample weights have been normalized (standardized).² Note that in Table SR.5.3, an additional column is presented (Weighted total number of children age 5-17 years) to account for the random selection of one child in households with at least one child age 5-17 years. The final weight of each child is the weight of the household multiplied by the number of children age 5-17 years in the household.

In addition to providing useful information on the background characteristics of women, children age 5-17, and children under age five, the tables are also intended to show the numbers of observations in

each background category. These categories are used in the subsequent tabulations of this report.

Table SR.5.1W provides background characteristics of female respondents, age 15-49 years. The tables include information on the distribution of women according to area, region, age, education³¹, marital/union status, motherhood status, health insurance, functional difficulties (for age 18-49), ethnicity of the household head, and wealth index quintiles.^{32,33}

Background characteristics of children age 5-17 and under 5 are presented in Tables SR.5.2 and SR.5.3. These include the distribution of children by several attributes: sex, area, region, age in months, mother's (or caretaker's) education, respondent type, health insurance, functional difficulties (for children under age 5 only for age 2-4 years), ethnicity of the household head and wealth index quintiles.

31. Throughout this report when used as a background variable, unless otherwise stated, "education" refers to highest educational level ever attended by the respondent.

32. The wealth index is a composite indicator of wealth. To construct the wealth index, principal components analysis is performed by using information on the ownership of consumer goods, dwelling characteristics, water and sanitation, and other characteristics that are related to the household's wealth, to generate weights (factor scores) for each of the items used. First, initial factor scores are calculated for the total sample. Then, separate factor scores are calculated for households in urban and rural areas. Finally, the urban and rural factor scores are regressed on the initial factor scores to obtain the combined, final factor scores for the total sample. This is carried out to minimize the urban bias in the wealth index values. Each household in the total sample is then assigned a wealth score based on the assets owned by that household and on the final factor scores obtained as described above. The survey household population is then ranked according to the wealth score of the household they are living in, and is finally divided into 5 equal parts (quintiles) from lowest (poorest) to highest (richest). In Trinidad and Tobago MICS, the following assets were used in these calculations: Number of rooms for sleeping; type of floor, roof and wall; fixed line telephone; radio; water storage tank; sofa/couch; table; bed; wardrobe/clothes cupboard; electric/gas stove; electricity; television; refrigerator; washing machine; air conditioning unit; water pump; clothes dryer; stereo; microwave; wristwatch; bicycle; motorcycle or scooter; animal-drawn cart; car, truck or van; boat with a motor; computer or tablet; mobile telephone; internet; agricultural land; farm animals or poultry; bank account; type of stove and type of fuel used for cooking; type of fuel used for lighting; source of and access to drinking water; sanitation facility; and handwashing facilities. The wealth index is assumed to capture the underlying long-term wealth through information on the household assets, and is intended to produce a ranking of households by wealth, from poorest to richest. The wealth index does not provide information on absolute poverty, current income or expenditure levels. The wealth scores calculated are applicable for only the particular data set they are based on. Further information on the construction of the wealth index can be found in:

Filmer, D., and L. Pritchett. "Estimating Wealth Effects without Expenditure Data – or Tears: An Application to Educational Enrollments in States of India." *Demography* 38, no. 1 (2001): 115-32. doi:10.1353/dem.2001.0003;

Rutstein, S., and K. Johnson. *The DHS Wealth Index*. DHS Comparative Reports No. 6. Calverton: ORC Macro, 2004. <https://dhsprogram.com/pubs/pdf/CR6/CR6.pdf>;

Rutstein, S. *The DHS Wealth Index: Approaches for Rural and Urban Areas*. Calverton: Macro International, 2008. <https://dhsprogram.com/pubs/pdf/WP60/WP60.pdf>.

33. When describing survey results by wealth quintiles, appropriate terminology is used when referring to individual household members, such as for instance "women in the richest population quintile", which is used interchangeably with "women in the wealthiest survey population", "women living in households in the richest population wealth quintile", and similar.

^AAs one child is randomly selected in each household with at least one child age 5-17 years, the final weight of each child is the weight of the household multiplied with the number of children age 5-17 years in the household. This column is the basis for the weighted percent distribution, i.e. the distribution of all children age 5-17 years in sampled households.

^BIn this table and throughout the report where applicable, mother's education refers to educational attainment of the respondent: Mothers (or caretakers, interviewed only if the mother is deceased or is living elsewhere). The category of "Emancipated" applies to children age 15-17 years as described in note C. This category is not presented in individual tables.

^CChildren age 15-17 years were considered emancipated and individually interviewed if not living with his/her mother and the respondent to the Household Questionnaire indicated that the child does not have a primary caretaker.

^DThe results of the Child Functioning module are presented in Chapter 11.1.

4.6

LITERACY

The literacy rate reflects the outcomes of primary education over the previous 30-40 years. As a measure of the effectiveness of the primary education system, it is often seen as a proxy measure of social progress and economic achievement. In MICS, literacy is assessed on the ability of the respondent to read a short simple statement or based on school attendance.

Table SR.6.1W shows the survey findings for the total number of interviewed women. The Youth Literacy Rate, MICS Indicator SR.2, is calculated for women age 15-24 years and presented in the Age disaggregate in the table.

Note that those who have ever attended lower secondary or higher education are immediately

classified as literate, due to their education level and are therefore not asked to read the statement. All others who successfully read the statement are also classified as literate. The tables are designed as full distributions of the survey respondents, by level of education ever attended. The total percentage literate presented in the final column is the sum of literate individuals among those with 1) pre-primary or no education, 2) primary education and 3) those with at least some secondary education.

The percent missing includes those for whom no sentence in the required language was available or for whom no response was reported.

MIGRATORY STATUS

The Background module of the Trinidad and Tobago MICS 2022 asked respondents to the Individual Questionnaire for Women how long they have been continuously living in the current residence and, if they were not living there since birth, whether they lived in a city, town or rural area and the name of the region they lived in before moving to their current place of residence.

Table SR.7.1W presents the percentage of women who have changed residence according to the time since last move and also compares the place of residence of each individual at the time of the survey with that of the last place of residence and the type of residence.

Table SR.7.1W: Migratory status (women)

Percent distribution of women age 15-49 years by migratory status and years since last migration, and percent distribution of women who migrated, by type and place of last residence, Trinidad and Tobago, 2022

MASS MEDIA AND ICT

The Trinidad and Tobago MICS 2022 collected information on exposure to mass media and the use of computers and the internet. Information was collected on exposure to newspapers/magazines, radio and television among women age 15-49 years and is presented in Table SR.9.1W.

Table SR.9.2 presents information on the household ownership of Information and Communication Technology (ICT) equipment (radio, television, fixed telephone line or mobile telephone³⁴ and computer) and access to internet.

Table SR.9.3W presents the use of ICT by women age 15-49 years based on the information about whether they have ever used computers, mobile phones or internet and during the last three months while Table SR.9.4W presents the ICT skills of women age 15-49 years based on the information about whether they carried out computer related activities in the last three months.

34. In addition to the specific question in the Household Questionnaire about whether any member of this household has a mobile phone, households are considered as owning mobile phone if any individual woman age 15-49 years responded yes to the question about ownership of mobile telephones in the individual questionnaires for women age 15-49 years.

Table SR.9.1W: Exposure to mass media (women)

Percentage of women age 15-49 years who are exposed to specific mass media on a weekly basis, Trinidad and Tobago, 2022

	Percentage of women who:					Number of women
	Read a newspaper at least once a week	Listen to the radio at least once a week	Watch television at least once a week	All three media at least once a week ¹	Any media at least once a week

TOBACCO AND ALCOHOL USE

Tobacco products are products made entirely or partly of leaf tobacco as raw material, which are intended to be smoked, sucked, chewed, or snuffed. All contain the highly addictive psychoactive ingredient, nicotine. Tobacco use is one of the main risk factors for a number of chronic diseases, including cancer, lung diseases, and cardiovascular diseases.³⁵ If mentioned, e-cigarettes are included in the other response category of smokeless tobacco product use.

The consumption of alcohol carries a risk of adverse health and social consequences related to its intoxicating, toxic and dependence-producing properties. In addition to the chronic diseases that may develop in those who drink large amounts of alcohol over a number of years, alcohol use is also associated with an increased risk of acute health conditions, such as injuries, including from traffic accidents.³⁶ Alcohol use also causes harm far beyond the physical and psychological health of the

drinker. It harms the well-being and health of people around the drinker. An intoxicated person can harm others or put them at risk of traffic accidents or violent behaviour, or negatively affect co-workers, relatives, friends or strangers. Thus, the impact of the harmful use of alcohol reaches deep into society.³⁷

The Trinidad and Tobago MICS 2022 collected information on ever and current use of tobacco and alcohol and intensity of use among women age 15-49 years. This section presents the main results.

Table SR.10.1W presents the current and ever use of tobacco products by women age 15-49 years. Table SR.10.2W presents results on age at first use of cigarettes, as well as frequency of use for women, while Table SR.10.3W shows the use of alcohol among women age 15-49 years.

CHILDREN'S LIVING ARRANGEMENTS

The Convention on the Rights of the Child (CRC) recognizes that “the child, for the full and harmonious development of his or her personality, should grow up in a family environment, in an atmosphere of happiness, love and understanding”. Millions of children around the world grow up without the care of their parents for several reasons, including due to the premature death of the parents or their migration for work. In most cases, these children are cared for by members of their extended families, while in others, children may be living in households other than their own, as live-in domestic workers for instance. Understanding the children’s living arrangements, including the composition of the households in which they live and the relationships with their primary caregivers, is key to design targeted interventions aimed at promoting child’s care and wellbeing.

Table SR.11.1 presents information on the living arrangements and orphanhood status of children under age 18.

The Trinidad and Tobago MICS 2022 included a simple measure of one particular aspect of migration related to what is termed “children left behind”, i.e. for whom one or both parents have moved abroad. While the amount of literature is growing, the long-term effects of the benefits of remittances versus the potential adverse psychosocial effects are not yet conclusive, as there is somewhat conflicting evidence available as to the effects on children. Table SR.11.2 presents information on the living arrangements and co-residence with parents of children under age 18. Table SR.11.3 presents information on children under age 18 years not living with a biological parent according to relationship to the head of household and those living in households headed by a family member.

Table SR.11.1: Children's living arrangements and orphanhood

Survive

5 Survive

With the SDG target (3.2) for child mortality, on ending preventable deaths of newborns and children under 5 years of age, the international community has retained the overarching goal of reducing child mortality. While the global target calls for reducing neonatal mortality to at least as low as 12 deaths per 1,000 live births and under-five mortality to at least as low as 25 deaths per 1,000 live births, reduction of child mortality continues to be one of the most important objectives in national plans and programmes in each and every country.

Mortality rates presented in this chapter are calculated from information collected in the birth histories of the Women's Questionnaires. All interviewed women were asked whether they had ever given birth, and those who had were asked to report the number of sons and daughters who live with them, the number who live elsewhere, and the number who have died. In addition, women were asked to provide detailed information on their live births, starting with the firstborn, in chronological order. This information included whether births were single or multiple, and for each live birth, sex, date of birth (month and year), and survival status.

Further, for children alive at the time of survey, women were asked the current age of the child; for deceased children, the age at death was obtained. Childhood mortality rates are expressed by conventional age categories and are defined as follows:

- Neonatal mortality (NN): probability of dying within the first month of life³⁸
- Post-neonatal mortality (PNN): difference between infant and neonatal mortality rates
- Infant mortality ($_{1q0}$): probability of dying between birth and the first birthday
- Child mortality ($_{4q1}$): probability of dying between the first and the fifth birthdays
- Under-five mortality ($_{5q0}$): the probability of dying between birth and the fifth birthday

Neonatal, infant and under-five mortality rates are expressed as deaths per 1,000 live births. Child mortality is expressed as deaths per 1,000 children surviving to age one. Post-neonatal mortality is calculated as the difference between infant and neonatal mortality rates.

38. The neonatal period is the first 28 days of life, however, traditionally the neonatal mortality rates are computed based on the first month of life in household surveys, which very closely approximates the 28-day definition.

Table CS.1 presents neonatal, post-neonatal, infant, child, and under-five mortality rates for the three most recent five-year periods before the survey. For each mortality rate in the table, it is possible to assess changes over time, during the last 15 years preceding the survey.

Tables CS.2 and CS.3 provide estimates of child mortality by socioeconomic and demographic characteristics. Using the rates calculated for the 5-year period immediately preceding the survey, differentials in mortality rates by socioeconomic characteristics, such as region, mother's education and wealth, and by demographic characteristics such as sex and mother's age at birth are presented.

6.1

FERTILITY

Measures of current fertility are presented in Table TM.1.1 for the three-year period preceding the survey. A three-year period was chosen for calculating these rates to provide the most current information, while also allowing the rates to be calculated for a sufficient number of cases so as not to compromise the statistical precision of the estimates. The current fertility measures, presented in the table by urban and rural residence, are as follows:

- Age-specific fertility rates (ASFRs), expressed as the number of births per 1,000 women in a specified age group, show the age pattern of fertility. Numerators for ASFRs are calculated by identifying live births that occurred in the three-year period preceding the survey, classified according to the age of the mother (in five-year age groups) at the time of the child's birth. Denominators of the rates represent the number of woman-years lived by all interviewed women (or in simplified terms, the average number of women) in each of the five-year age groups during the specified period.
- The total fertility rate (TFR) is a synthetic measure that denotes the number of live births a woman would have if she were subject to the current age-specific fertility rates throughout her reproductive years (15-49 years).
- The general fertility rate (GFR) is the number of live births occurring during the specified period per 1,000 women age 15-49.
- The crude birth rate (CBR) is the number of live births per 1,000 household population during the specified period.

Table TM.1.1: Fertility rates

Adolescent birth rate, age-specific and total fertility rates, the general fertility rate, and the crude birth rate for the three-year period preceding the survey, by area of residence, Trinidad and Tobago, 2022

CBR ^D	7.7	9.1	8.3

¹ MICS indicator TM.1 - Adolescent birth rate (age 15-19 years); SDG indicator 3.7.2

^A The age-specific fertility rates (ASFR) are the number of live births in the last 3 years, divided by the average number of women in that age group during the same period, expressed per 1,000 women. The age-specific fertility rate for women age 15-19 years is also termed as the adolescent birth rate

^B TFR: The Total Fertility Rate is the sum of age-specific fertility rates of women age 15-49 years. The TFR denotes the average number of children to which a woman will have given birth by the end of her reproductive years (by age 50) if current fertility rates prevailed. The rate is expressed per woman age 15-49 years

^C GFR: The General Fertility Rate is the number of births in the last 3 years divided by the average number of women age 15-49 years during the same period, expressed per 1,000 women age 15-49 years

^D CBR: The Crude Birth Rate is the number of births in the last 3 years, divided by the total population during the same period, expressed per 1,000 population

6.2

EARLY CHILDBEARING

Table TM.2.1 presents the survey findings on adolescent birth rates and further disaggregates of the total fertility rate.

The adolescent birth rate (age-specific fertility rate for women age 15-19) is defined as the number of births to women age 15-19 years during the three-year period preceding the survey, divided by the average number of women age 15-19 (number of women-years lived between ages 15 through 19, inclusive) during the same period, expressed per 1,000 women.

The adolescent birth rate is a Global SDG indicator (3.7.2) for ensuring universal access to sexual and reproductive health-care services (Target 3.7).

Table TM.2.2W presents a selection of early childbearing indicators for young women age 15-19 and 20-24 years. In Table TM.2.2W, percentages

among women age 15-19 who have had a live birth and those who are pregnant with their first child are presented. For the same age group, the table also presents the percentage of women who have had a live birth before age 15. These estimates are all derived from the detailed birth histories of women.

To estimate the proportion of women who have had a live birth before age 18 – when they were still children themselves – data based on women age 20-24 years at the time of survey are used to avoid truncation.³⁹

Table TM.2.3W is designed to look at trends in early childbearing for women by presenting percentages of women who became mothers before ages 15 and 18, for successive age cohorts. The table is designed to capture trends in urban and rural areas separately.

39. Using women age 15-19 to estimate the percentage who had given birth before age 18 would introduce truncation to the estimates, since the majority of women in this age group will not have completed age 18, and therefore will not have completed exposure to childbearing before age 18. The age group 20-24 is used to estimate the percentage of women giving birth before age 18, since all women in this age group have completed exposure to childbearing at very early ages.

6.3

CONTRACEPTION

Appropriate contraceptive use is important to the health of women and children by: 1) preventing pregnancies that are too early or too late; 2) extending the period between births; and 3) limiting the total number of children.⁴⁰

Table TM.3.1 presents the current use of contraception for women who are currently married or in union while Table TM.3.2 presents the same information for women who are not currently married or in union and are sexually active. In Table TM.3.1, use of specific methods of contraception are first presented; specific methods are then grouped into modern and traditional methods and presented as such. For sexually active women who are not currently married or in union, in Table TM.3.2, contraceptive use is only presented by modern and traditional method categories.

Unmet need for contraception refers to fecund women who are not using any method of contraception, but who wish to postpone the next birth (spacing) or who wish to stop childbearing altogether (limiting). Unmet need is identified in

MICS by using a set of questions eliciting current behaviours and preferences pertaining to contraceptive use, fecundity, and fertility preferences.

Table TM.3.3 shows the levels of unmet need and met need for contraception, and the demand for contraception satisfied for women who are currently married or in union. The same table is reproduced in Table 3.4 for sexually active women who are not currently married or in union.

Unmet need for spacing is defined as the percentage of women who are not using a method of contraception AND

- are i) not pregnant, ii) not post-partum amenorrheic⁴¹ and iii) fecund⁴² and say they want to wait two or more years for their next birth OR
- are i) not pregnant, ii) not post-partum amenorrheic, and iii) fecund and unsure whether they want another child OR

40. PATH, and United Nations Population Fund. Meeting the Need: Strengthening Family Planning Programs. Seattle: PATH/UNFPA, 2006. https://www.unfpa.org/sites/default/files/resource-pdf/family_planning06.pdf.

41. A woman is post-partum amenorrheic if she had a live birth in last two years and is not currently pregnant, and her menstrual period has not returned since the birth of the last child.

42. A woman is considered infecund if she is neither pregnant nor post-partum amenorrheic, and

(1a) has not had menstruation for at least six months, or (1b) has never menstruated, or (1c) had last menstruation occurring before her last birth, or (1d) is in menopause/has had hysterectomy OR

(2) she declares that she i) has had hysterectomy, ii) has never menstruated, iii) is menopausal or iv) has been trying to get pregnant for at least 2 years without result in response to questions on why she thinks she is not physically able to get pregnant at the time of survey OR

(3) she declares she cannot get pregnant when asked about desire for future birth OR

(4) she has not had a birth in the preceding 5 years, is currently not using contraception and is currently married and was continuously married during the last 5 years preceding the survey.

- are pregnant, and say that pregnancy was mistimed (would have wanted to wait) OR
- are post-partum amenorrheic and say that the birth was mistimed (would have wanted to wait).

Unmet need for limiting is defined as percentage of women who are married or in union and are not using a method of contraception AND

- are i) not pregnant, ii) not post-partum amenorrheic, and iii) fecund and say they do not want any more children OR
- are pregnant and say they did not want to have a child OR
- are post-partum amenorrheic and say that they did not want the birth.

Total unmet need for contraception is the sum of unmet need for spacing and unmet need for limiting.

Met need for limiting includes women who are using (or whose partner is using) a contraceptive method⁴³ and who want no more children, are using male or female sterilisation or declare themselves as infecund. Met need for spacing includes women

who are using (or whose partner is using) a contraceptive method and who want to have another child or are undecided whether to have another child. Summing the met need for spacing and limiting results in the total met need for contraception.

Using information on contraception and unmet need, the percentage of demand for contraception satisfied is also estimated from the MICS data. The percentage of demand satisfied is defined as the proportion of women who are currently using contraception over the total demand for contraception. The total demand for contraception includes women who currently have an unmet need (for spacing or limiting) plus those who are currently using contraception.

Percentage of demand for family planning satisfied with modern methods is one of the indicators used to track progress toward the Sustainable Development Goal, Target 3.7, on ensuring universal access to sexual and reproductive health-care services, including for family planning, information and education and the integration of reproductive health into national strategies and programmes. While SDG indicator 3.7.1 relates to all women age 15-49 years, it is only reported for women currently married or in union and, therefore, located in Table TM.3.3 alone.

43. In this chapter, whenever reference is made to the use of a contraceptive by a woman, this includes her partner using a contraceptive method (such as male condom).

Table TM.3.1: Use of contraception (currently married/in union)

Percentage of women age 15-49 years currently married or in union who are using (or whose partner is using) a contraceptive method, Trinidad and Tobago, 2022

PRENATAL CARE

The prenatal period presents important opportunities for reaching pregnant women with a number of interventions that may be vital to their health and well-being and that of their infants. For example, prenatal care can be used to inform women and families about risks and symptoms in pregnancy and about the risks of labour and delivery, and therefore it may provide the route for ensuring that pregnant women do, in practice, deliver with the assistance of a skilled health care provider. Prenatal visits also provide an opportunity to supply information on birth spacing, which is recognised as an important factor in improving infant survival.

WHO recommends a minimum of eight prenatal visits based on a review of the effectiveness of different models of prenatal care.⁴⁴ WHO guidelines are specific on the content on prenatal care visits, which include:

- Blood pressure measurement
- Urine testing for bacteriuria and proteinuria
- Blood testing to detect syphilis and severe anaemia

- Weight/height measurement (optional).

It is of crucial importance for pregnant women to start attending prenatal care visits as early in pregnancy as possible and ideally have the first visit during the first trimester to prevent and detect pregnancy conditions that could affect both the woman and her baby. Prenatal care should continue throughout the entire pregnancy.⁴⁴

Prenatal care is a tracer indicator of the Reproductive and Maternal Health Dimension of SDG 3.8 Universal Health Coverage. The type of personnel providing prenatal care to women age 15-49 years who gave birth in the two years preceding is presented in Table TM.4.1.

Table TM.4.2 shows the number of prenatal care visits during the pregnancy of their most recent birth within the two years preceding the survey, regardless of provider, by selected characteristics. Table TM.4.2 also provides information about the timing of the first prenatal care visit.

The coverage of key services that pregnant women are expected to receive during prenatal care are shown in Table TM.4.3.

6.5

NEONATAL TETANUS

Tetanus immunisation during pregnancy can be life-saving for both the mother and the infant.⁴⁵

WHO estimated that neonatal tetanus killed more than 31,000 newborn children in 2016 within their first month of life.⁴⁶

SDG 3.1 aims at reducing by 2030 the global maternal mortality ratio to less than 70 per 100,000 live births. Eliminating maternal tetanus is one of the strategies used to achieve SDG target 3.1.

The strategy for preventing maternal and neonatal tetanus is to ensure that all pregnant women receive at least two doses of tetanus toxoid vaccine. If a woman has not received at least two doses of tetanus toxoid during a particular pregnancy, she (and her newborn) are also considered to be protected against tetanus if the woman:

- Received at least two doses of tetanus toxoid vaccine, the last within the previous 3 years;
- Received at least 3 doses, the last within the previous 5 years;

- Received at least 4 doses, the last within the previous 10 years;

- Received 5 or more doses anytime during her life.⁴⁷

To assess the status of tetanus vaccination coverage, women who had a live birth during the two years before the survey were asked if they had received tetanus toxoid injections during the pregnancy for their most recent birth, and if so, how many. Women who did not receive two or more tetanus toxoid vaccinations during this recent pregnancy were then asked about tetanus toxoid vaccinations they may have previously received. Interviewers also asked women to present their vaccination card on which dates of tetanus toxoid are recorded and referred to information from the cards when available.

Table TM.5.1 shows the protection status from tetanus of women who have had a live birth within the last 2 years.

DELIVERY CARE

Increasing the proportion of births that are delivered in health facilities is an important factor in reducing the health risks to both the mother and the baby. Proper medical attention and hygienic conditions during delivery can reduce the risks of complications and infection that can cause morbidity and mortality to either the mother or the baby.⁴⁸

Table TM.6.1 presents the percent distribution of women age 15-49 who had a live birth in the two years preceding the survey by place of delivery of the most recent birth, and the percentage of their most recent births delivered in a health facility, according to background characteristics.

About three quarters of all maternal deaths occur due to direct obstetric causes.⁴⁹ The single most critical intervention for safe motherhood is to ensure that a competent health worker with midwifery skills is present at every birth, and, in case of emergency, that there is a referral system in place to provide obstetric care in the right level of facility.⁴⁸ The skilled attendant at delivery indicator is used to track progress toward the Sustainable Development Goal 3.1 of reducing maternal mortality and it is SDG indicator 3.1.2.

The MICS included questions to assess the proportion of births attended by a skilled attendant. According to the revised definition⁴⁸, skilled health personnel, as referenced by SDG indicator 3.1.2, are competent maternal and newborn health professionals educated, trained and regulated to national and international standards. They are competent to: facilitate physiological processes during labour to ensure clean and safe birth; and identify and manage or refer women and/or newborns with complications.

Table TM.6.2 presents information on assistance during delivery of the most recent birth in the two years preceding the survey. Table TM.6.2 also shows information on women who delivered by caesarean section (C-section) and provides additional information on the timing of the decision to conduct a C-section (before labour pains began or after) to better assess if such decisions are mostly driven by medical or non-medical reasons.

BIRTHWEIGHT

Weight at birth is a good indicator not only of a mother's health and nutritional status but also the newborn's chances for survival, growth, long-term health and psychosocial development. Low birth weight (LBW), defined as a birthweight less than 2,500 grams (g) regardless of gestational age, carries a range of grave health and developmental risks for children. LBW babies face a greatly increased risk of dying during their early days with more than 80% of neonatal deaths occurring in LBW newborns; recent evidence also links increased mortality risk through adolescence to LBW. For those who do survive, LBW contributes to a wide range of poor health outcomes including higher risk of stunted linear growth in childhood, and long-term effects into adulthood such as lower IQ and an increased risk of chronic conditions including obesity, diabetes and cardiovascular problems.^{50,51}

Premature birth, being born before 37 weeks gestation, is the primary cause of LBW given that a

baby born early has less time to grow and gain weight in utero, especially as much of the foetal weight is gained during the latter part of pregnancy. The other cause of LBW is intrauterine growth restriction which occurs when the foetus does not grow well because of problems with the mother's health and/or nutrition, placental problems, or birth defects. While poor dietary intake and disease during pregnancy can affect birthweight outcome, an intergenerational effect has also been noted with mothers who were themselves LBW having an increased risk of having an LBW offspring.^{52,53,54} Short maternal stature and maternal thinness before pregnancy can increase risk of having an LBW child which can be offset by dietary interventions including micronutrient supplementation.^{55,56} Other factors such as cigarette smoking during pregnancy can increase the risk of LBW, especially among certain age groups.^{57,58}

A major limitation of monitoring LBW globally is the lack of birthweight data for many children, especially in some countries. There is a notable bias among the unweighed, with those born to poorer, less educated, rural mothers being less likely to have a birthweight when compared to their richer, urban counterparts with more highly educated mothers. As the characteristics of the unweighed are related to being LBW, LBW estimates that do not represent these children may be lower than the true value. Furthermore, poor quality of available data with regard to excessive heaping on multiples of 500 g or 100 g exists in the majority of available data from low and middle-income countries and can further bias LBW estimates.⁵⁹ To help overcome some of these limitations, a method was developed to adjust LBW estimates for missing birth weights and heaping on 2,500 g.⁶⁰ This method comprises a single imputation allowing births with missing birthweights to be included in the LBW estimate using data on maternal perception of size at birth,

and also moved 25 per cent of data heaped on 2500 g to the LBW category. This was applied to available household survey data and the results were reflected in the UNICEF global LBW database between 2004 and 2017. This computation has been used in earlier rounds of MICS reports.

However, the method of estimating LBW has now been replaced with superior modelling. Currently, this new method is not ready for inclusion in the standard tabulations of MICS. Table TM.7.1 therefore presents only the percentage of children weighed at birth and the crude percentage of LBW among children weighed at birth as reported on available cards or from mother's recall. It should be noted that this crude estimate is likely not representative of the full population (typically an underestimate of true LBW prevalence) and therefore must be interpreted with some caution.

¹ MICS indicator TM.11 - Infants weighed at birth

^A The indicator includes children that were reported weighed at birth, but with no actual birthweight recorded or recalled

^B The values here are as recorded on card or as reported by respondent. The total crude low birthweight typically requires adjustment for missing birthweights, as well as heaping, particularly at exactly 2,500 gram. The results presented here cannot be considered to represent the precise rate of low birthweight (very likely an underestimate) and therefore not reported as a MICS indicator.

() Figures that are based on 25-49 unweighted cases

POST-NATAL CARE

The time of birth and immediately after is a critical window of opportunity to deliver lifesaving interventions for both the mother and newborn. Across the world, approximately 2.6 million newborns annually die in the first month of life⁶¹ and the majority of these deaths occur within a day or two of birth⁶², which is also the time when the majority of maternal deaths occur⁶³.

Essential components of the content of post-natal care include, but are not limited to, thermal and cord care, breastfeeding counselling, assessing the baby's temperature, weighing the baby and

counselling the mother on danger signs for newborns. Thermal care and cord care are essential elements of newborn care which contributes to keeping the baby stable and preventing hypothermia. Appropriate cord care is important for preventing life-threatening infections for both mother and baby.⁶⁴ Table TM.8.4 presents the percentage of last-born children in the last 2 years who were dried after birth, percentage who were given skin to skin contact and percent distribution of timing of first bath.

SEXUAL BEHAVIOUR

Promoting safer sexual behaviour is critical for reducing the risk of HIV transmission. The consistent use of condoms during sex, especially when non-regular or multiple partners are involved, is particularly important for reducing the spread of HIV.^{65,66} A set of questions was administered to all women 15-49 years of age to assess their risk of HIV infection. Table TM.10.1W presents the percentage of women age 15-49 years who ever had sex, percentage who had sex in the last 12 months, percentage who had sex with more than

one partner in the last 12 months, and among those who had sex with multiple partners in the last 12 months, the percentage who used a condom at last sex.

Certain behaviour at a young age may create, increase, or perpetuate risk of exposure to HIV. Such behaviour includes sex at an early age and women having sex with older men.⁶⁶ Table TM.10.2W shows the percentage of women age 15-24 years such key sexual behaviour indicators.

6.10

HIV

Some of the most important prerequisites for reducing the rate of HIV infection is accurate knowledge of how HIV is transmitted and strategies for preventing transmission.⁶⁵ Correct information is the first step towards raising awareness and giving adolescents and young people the tools to protect themselves from infection. Misconceptions about HIV are common and can confuse adolescents and young people and hinder prevention efforts.^{65,66} The UN General Assembly Special Session on HIV/AIDS (UNGASS) called on governments to improve the knowledge and skills of young people to protect themselves from HIV.^{65,66} The HIV module administered to women 15-49 years of age addresses part of this call.

The Global AIDS Monitoring (GAM) Reporting indicator: the percentage of young people who have comprehensive and correct knowledge of HIV prevention and transmission, is defined as 1) knowing that consistent use of a condom during sexual intercourse and having just one uninfected faithful partner can reduce the chance of getting HIV, 2) knowing that a healthy-looking person can have HIV, and 3) rejecting the two most common local misconceptions about transmission/prevention of HIV. In the Trinidad and Tobago 2022 MICS all

women who have heard of AIDS were asked questions on all three components and the results are detailed in Tables TM.11.1W.

Table TM.11.1W also presents the percentage of women who can correctly identify misconceptions concerning HIV. The indicator is based on the two most common and relevant misconceptions in Trinidad and Tobago, that HIV can be transmitted by sharing food with someone who has HIV or by mosquito bites. The tables also provide information on whether women know that HIV cannot be transmitted by sharing food with someone who has HIV or by mosquito bites.

Knowledge of mother-to-child transmission of HIV is also an important first step for women to seek HIV testing when they are pregnant to avoid infection in the baby. Women should know that HIV can be transmitted during pregnancy, during delivery, and through breastfeeding. The level of knowledge among women age 15-49 years concerning mother-to-child transmission is presented in Table TM.11.2W.

Discrimination is a human rights violation prohibited by international human rights law and most national

constitutions. Discrimination in the context of HIV refers to unfair or unjust treatment (an act or an omission) of an individual based on his or her real or perceived HIV status. Discrimination exacerbates risks and deprives people of their rights and entitlements, fuelling the HIV epidemic.⁶⁶

The following questions were asked in the Trinidad and Tobago 2022 MICS to measure stigma and discriminatory attitudes that may result in discriminatory acts (or omissions): whether the respondent 1) would buy fresh vegetables from a shopkeeper or vendor who has HIV; 2) thinks that children living with HIV should be allowed to attend school with children who do not have HIV; 3) thinks people hesitate to take an HIV test because they are afraid of how other people will react if the test result is positive for HIV; 4) thinks people talk badly about those living with HIV, or who are thought to be living with HIV; 5) thinks people living with HIV, or thought to be living with HIV, lose the respect of other people; 6) agrees or disagrees with the statement ‘I would be ashamed if someone in my family had HIV’; and 7) fears that she could get HIV if she comes into contact with the saliva of a person living with HIV. Table TM.11.3W presents the attitudes of women towards people living with HIV. Another important indicator is the knowledge of where to be tested for HIV and use of such services.

In order to protect themselves and to prevent infecting others, it is important for individuals to know their HIV status. Knowledge of own status is also a critical factor in the decision to seek treatment.^{65,66} Questions related to knowledge of a facility for HIV testing and whether a person has ever been tested are presented in Tables TM.11.4W and TM.11.4M.

Among women who had given birth within the two years preceding the survey, the percentage who received counselling and HIV testing during prenatal care is presented in Table TM.11.5. This indicator is used to track progress towards global and national goals to eliminate mother-to-child transmission of HIV. High coverage enables early initiation of care and treatment for HIV positive mothers required to live healthy and productive lives

In many countries, over half of new adult HIV infections are among young people age 15-24 years thus a change in behaviour among members of this age group is especially important to reduce new infections.^{65,66} The next tables present specific information on this age group. Tables TM.11.6W summarises information on key HIV indicators for young women.

Table TM.11.1W: Knowledge about HIV transmission, misconceptions about HIV, and comprehensive knowledge about HIV transmission (women)

Percentage of women age 15-49 years who know the main ways of preventing HIV transmission, percentage who know that a healthy-looking person can be HIV-positive, percentage who reject common misconceptions, and percentage who have comprehensive knowledge of HIV transmission, Trinidad and Tobago, 2022

	Percentage who have heard of AIDS	Percentage who know transmission can be prevented by:			Percentage who know that a healthy-looking person can be HIV-positive	Percentage who know that HIV cannot be transmitted by:			Percentage who reject the two most common misconceptions and know that a healthy-looking person can be HIV-positive	Percentage with comprehensive knowledge ^{1A}	Number of women
		Having only one faithful uninfected sex partner	Using a condom every time	Both		Mosquito bites	Supernatural means	Sharing food with someone with HIV

7 Thrive – Child Health, Nutrition And Development

7.1 IMMUNISATION

Immunisation is a proven tool for controlling and eliminating life-threatening infectious diseases and is estimated to avert between 2 and 3 million deaths each year.⁶⁷ It is one of the most cost-effective health investments, with proven strategies that make it accessible to even the most hard-to-reach and vulnerable populations.

The WHO Recommended Routine Immunisations for Children⁶⁸ recommends all children to be vaccinated against tuberculosis, diphtheria, tetanus,

pertussis, polio, measles, hepatitis B, haemophilus influenzae type b, pneumococcal bacteria/disease, rotavirus, and rubella.⁶⁹

At the global level, SDG indicator 3.b.1 is used to monitor the progress of the vaccination of children at the national level. The proportions of the target population covered by DTP, pneumococcal (conjugate) and measles are presented in Table TC.1.1.

All doses in the primary series are recommended to be completed before the child's first birthday, although depending on the epidemiology of disease in a country, the first doses of measles and rubella containing vaccines may be recommended at 12 months or later. The recommended number and timing of most other doses also vary slightly with local epidemiology and may include booster doses later in childhood.

67. "Immunization Highlights 2015." World Health Organization. June 27, 2016. Accessed August 23, 2018. <http://www.who.int/immunization/highlights/2015/en/>.

68. "WHO Recommendations for Routine Immunization - Summary Tables." World Health Organization. August 22, 2018. Accessed August 23, 2018. http://www.who.int/immunization/policy/immunization_tables/en/.

69. Additionally, vaccination against the human papillomavirus (HPV) is recommended for girls from 9 to 14 years of age, but coverage of this vaccine is not yet included in MICS, as methodology is under development.

Immunisation Schedule Trinidad and Tobago⁷⁰

Age	Dose	Vaccine
Birth	Birth Dose	Hepatitis B
2 months	1st	DPT / Hep B / Hib, Pneumococcal, IPV
4 months	2nd	DPT / Hep B / Hib, Pneumococcal, OPV
6 months	3rd	DPT / Hep B / Hib, Pneumococcal, OPV
12 months	1st	Measles, Mumps, Rubella, Yellow Fever vaccine
18 months	1st Booster	DPT, OPV, Pneumococcal
2 years	2nd Booster	Measles, Mumps, Rubella
4-5 years	2nd Booster	DPT, OPV

Taking into consideration this vaccination schedule, the estimates for full vaccination coverage from the Trinidad and Tobago 2022 MICS are based on children age 12-23/24-35 months.

Information on vaccination coverage was collected for all children under three years of age. All mothers or caretakers were asked to provide vaccination cards. If the vaccination card for a child was available, interviewers copied vaccination information from the cards onto the MICS questionnaire. If no vaccination card was available for the child, the interviewer proceeded to ask the mother to recall whether the child had received

each of the vaccinations, and, for applicable antigens, how many doses were received. The final vaccination coverage estimates are based on information obtained from the vaccination card and the mother's report of vaccinations received by the child.

Table TC.1.2 presents vaccination coverage estimates among children age 12-23 and 24-35 months by background characteristics. The figures indicate children receiving the vaccinations at any time up to the date of the survey and are based on information from both the vaccination cards and mothers'/caretakers' reports.

7.2

DISEASE EPISODES

A key strategy for achieving progress toward SDG 3.2: By 2030, end preventable deaths of newborns and children under 5 years of age, with all countries aiming to reduce neonatal mortality to at least as low as 12 per 1,000 live births and under-5 mortality to at least as low as 25 per 1,000 live births, is to tackle the diseases such as diarrhoea, pneumonia and malaria which are still among the leading killers of children under 5.⁷¹ Target 3.3 of the SDGs on ending the epidemics on malaria by 2030 along with other diseases is interpreted as the attainment of the Global Technical Strategy for malaria 2016–2030 and the Roll Back Malaria advocacy plan, Action and Investment to defeat Malaria 2016–2030 targets which aim at reducing malaria mortality rates globally by 90 percent compared with 2015.

Table TC.2.1 presents the percentage of children under 5 years of age who were reported to have had an episode of diarrhoea, symptoms of acute respiratory infection (ARI) or fever during the 2 weeks preceding the survey. These results are not measures of true prevalence, and should not be used as such, but rather the period-prevalence of those illnesses over a two-week time window.

The definition of a case of diarrhoea or fever, in this survey, was the mother's (or caretaker's) report that

the child had such symptoms over the specified period; no other evidence was sought beside the opinion of the mother. A child was considered to have had symptoms of ARI if the mother or caretaker reported that the child had, over the specified period, an illness with a cough with rapid or difficult breathing, and whose symptoms were perceived to be due to a problem in the chest or both a problem in the chest and a blocked or runny nose. While this approach is reasonable in the context of a multi-topic household survey, these basically simple case definitions must be kept in mind when interpreting the results, as well as the potential for reporting and recall biases. Further, diarrhoea, fever and ARI are not only seasonal but are also characterized by the often rapid spread of localized outbreaks from one area to another at different points in time. The timing of the survey and the location of the teams might thus considerably affect the results, which must consequently be interpreted with caution. For these reasons, although the period-prevalence over a two-week time window is reported, these data should not be used to assess the epidemiological characteristics of these diseases but rather to obtain denominators for the indicators related to use of health services and treatment.

71. The main killers of children under age 5 in 2016 included preterm birth complications (18 per cent), pneumonia (16 per cent), intrapartum related events (12 per cent), diarrhoea (8 per cent), neonatal sepsis (7 per cent) and malaria (5 per cent). UNICEF et al. Levels and Trends in Child Mortality Report 2017. New York: UNICEF, 2017. https://www.unicef.org/publications/index_101071.html.

7.3

DIARRHOEA

Diarrhoea is one of the leading causes of death among children under five worldwide.⁷² Most diarrhoea-related deaths in children are due to dehydration from loss of large quantities of water and electrolytes from the body in liquid stools. Management of diarrhoea – either through oral rehydration salt solution (ORS) or a recommended homemade fluid (RHF) – can prevent many of these deaths.⁷³ In addition, provision of zinc supplements has been shown to reduce the duration and severity of the illness as well as the risk of future episodes within the next two or three months.

Almost 60 per cent of deaths due to diarrhoea worldwide are attributable to unsafe drinking water and poor hygiene and sanitation. Hand washing with soap alone can cut the risk of diarrhoea by at least 40 per cent and significantly lower the risk of respiratory infections. Clean home environments and good hygiene are important for preventing the spread of both pneumonia and diarrhoea, and safe drinking water and proper disposal of human waste, including child faeces, are vital to stopping the spread of diarrhoeal disease among children and adults.⁶⁸

In the MICS, mothers or caretakers were asked whether their child under age five years had an episode of diarrhoea in the two weeks prior to the survey. In cases where mothers reported that the child had diarrhoea, a series of questions were asked about the treatment of the illness, including what the child had been given to drink and eat during the episode and whether this was more or less than what was usually given to the child.

Table TC.3.1 shows the percentage of children age 0-59 months with diarrhoea in the two weeks preceding the survey for whom advice or treatment was sought and from where.

Table TC.3.2 shows patterns on drinking and feeding practices during diarrhoea among children age 0-59 months.

Table TC.3.3 shows the percentage of children age 0-59 months receiving ORS, various types of recommended homemade fluids and zinc during the episode of diarrhoea. Since children may have been given more than one type of liquid, the percentages do not necessarily add to 100.

72. UNICEF. One is Too Many: Ending Child Deaths from Pneumonia and Diarrhoea. New York: UNICEF, 2016. <https://data.unicef.org/wp-content/uploads/2016/11/UNICEF-Pneumonia-Diarrhoea-report2016-web-version.pdf>

73. In 2004, UNICEF and WHO published a joint statement with diarrhoea treatment recommendations for low-income countries, which promotes low-osmolarity rehydration salts (ORS) and zinc, in addition to continued feeding: WHO, and UNICEF. Clinical Management of Acute Diarrhoea. Joint Statement, New York: UNICEF, 2004. https://www.unicef.org/publications/files/ENAcute_Diarrhoea_reprint.pdf

Table TC3.4 provides the proportion of children age 0-59 months with diarrhoea in the last two weeks who received oral rehydration therapy with continued feeding, and the percentage of children with diarrhoea who received other treatments.

Table TC.3.5 provides information on the source of ORS and zinc for children age 0-59 months who received these treatments.

Table TC.3.1: Care-seeking during diarrhoea

Percentage of children age 0-59 months with diarrhoea in the last two weeks for whom advice or treatment was sought, by source of advice or treatment, Trinidad and Tobago, 2022

	Percentage of children with diarrhoea for whom:							Number of children with diarrhoea in the last two weeks
	Advice or treatment was sought from:

7.4

HOUSEHOLD ENERGY USE

There is a global consensus and an ever-growing body of evidence that expanding access to clean household energy for cooking, heating, and lighting is key to achieving a range of global priorities such as improving health, gender equality, equitable economic development and environmental protection. Goal 7 of the Sustainable Development Goals seeks to ensure access to affordable, reliable sustainable and modern energy for all by 2030 and would be measured as the percentage of the population relying on clean fuels and technology.⁷⁴

The Trinidad and Tobago 2022 MICS included a module with questions to assess the main technologies and fuels used for cooking, heating, and lighting. Information was also collected about the use of technologies with chimneys or other venting mechanisms which can improve indoor air quality through moving a fraction of the pollutants outdoors.

Households that use clean fuels and technologies for cooking are those mainly using electric stove, solar cooker, LPG (Liquefied Petroleum Gas)/cooking gas stove, biogas stove, or a liquid fuel stove burning ethanol/alcohol only. Table TC.4.1

presents the percent distribution of household members according to type of cookstove mainly used by the household and percentage of household members living in households using clean fuels and technologies for cooking.

Table TC.4.2 further presents the percent distribution of household members using polluting fuels and technologies for cooking according to type of cooking fuel mainly used by the household, and percentage of household members living in households using polluting fuels and technologies for cooking while Table TC.4.3 presents the percent distribution of household members in households using polluted fuels for cooking by type and characteristics of cookstove and by place of cooking. Households that use clean fuels and technologies for space heating are those mainly relying on central heating or using solar air heater, electricity, piped natural gas, LPG/cooking gas, biogas, or alcohol/ethanol. Table TC.4.4 presents the percent distribution of household members according to type of fuel mainly used for space heating by the household, and percentage of household members living in households using clean fuels and technologies for space heating. Table TC.4.5

74. WHO. Burning Opportunity: Clean Household Energy for Health, Sustainable Development, and Wellbeing of Women and Children. Geneva: WHO Press, 2016. http://apps.who.int/iris/bitstream/handle/10665/204717/9789241565233_eng.pdf;jsessionid=63CEC48ED96098D4256007A76FEB8907?sequence=1.

presents the percent distribution of household members by the type of space heating mainly used in the household and presence of chimney.

Households that use clean fuels and technologies for lighting are those mainly using electricity, solar lantern, rechargeable or battery powered flashlight, torch or lantern, or biogas lamp. Table TC.4.6 presents the percent distribution of household members according to type of lighting fuel mainly used for lighting by the household, and percentage of household members living in households using clean fuels and technologies for lighting.

The questions asked about cooking, space heating and lighting help to monitor SDG indicator 7.1.2, “Proportion of population with primary reliance on clean fuels and technology” for cooking, space heating and lighting. Table TC.4.7 presents the percentage of household members living in households using clean fuels and technologies for cooking, space heating, and lighting.

Table TC.4.1: Primary reliance on clean fuels and technologies for cooking

Percent distribution of household members by type of cookstove mainly used by the household and percentage of household members living in households using clean fuels and technologies for cooking, Trinidad and Tobago, 2022

7.6

FEVER

A fever is often an indication that something is wrong in the body, and could serve as a signal of a need to seek medical care to determine and treat the cause. The Trinidad and Tobago 2022 MICS included questions about whether the child had a fever in the last two weeks before the survey and what treatment, if any, was given.

Table TC.6.10 presents the percentage of children under age five with fever in the last two weeks for

whom advice or treatment was sought by source of advice or treatment. Table TC.6.11 provides further insight on treatment of children with fever.

Mothers were also asked to report all of the medicines given to a child to treat the fever, including both medicines given at home and medicines given or prescribed at a health facility.

Table TC.6.10: Care-seeking during fever

Percentage of children age 0-59 months with fever in the last two weeks for whom advice or treatment was sought, by source of advice or treatment, Trinidad and Tobago, 2022

	Percentage of children with fever for whom:						Number of children age 0-59 months with fever in last two weeks
	Advice or treatment was sought from:

7.7

INFANT AND YOUNG CHILD FEEDING

Optimal infant and young child feeding practices can increase survival and promote healthy growth and development, particularly during the critical window from birth to 2 years of age.

Breastfeeding in the first few years of life protects children from infection, provides an ideal source of nutrients and is economical and safe.⁷⁵ Despite these critical benefits, breastfeeding practices are suboptimal in many parts of the world. Many children do not start breastfeeding early enough, do not breastfeed exclusively for the recommended six months or stop breastfeeding too soon.⁷⁶ Mothers often face pressures to switch to infant formula, which can contribute to growth faltering and micronutrient malnutrition. Infant formula and other breastmilk substitutes can also be life-threatening in settings where hygienic conditions and safe drinking water are not readily available. In some cases, it can be unsafe even with proper and hygienic preparation in the home due to food adulteration or other contamination that can affect

unaware consumers.⁷⁷ As children reach the age of 6 months, their consumption of appropriate, adequate and safe complementary foods and continued breastfeeding leads to better health and growth outcomes, with the potential to reduce stunting during the first two years of life.⁷⁸

UNICEF and WHO recommend that infants be: (i) breastfed within one hour of birth; (ii) breastfed exclusively for the first six months of life; and (iii) breastfed for up to 2 years of age and beyond.⁷⁹ Starting at 6 months, breastfeeding should be combined with safe, age-appropriate feeding of solid, semi-solid and soft foods with specific guiding principles available about how the feeding should be done with topics ranging from food consistency to responsive feeding.^{80,81} The breastfeeding recommendations and guiding principles for complementary feeding for which standard indicators^{82,83} have been developed, and which are collected in this survey, are listed in the table below.

Recommendation/ Guiding Principle	Indicators /Proximate Measures ⁸⁴	Notes On Interpretation ⁸⁵	Table
Breastfeed within one hour of birth	Early Initiation of breastfeeding Percentage of most recent live-born children to women with a live birth in the last 2 years who were put to the breast within one hour of birth	This is the only indicator in the series based on historical recall, that is, of what happened up to 2 years before the survey interview.	TC.7.1
Breastfeed exclusively for the first six months of life	Exclusive breastfeeding under 6 months Percentage of infants under 6 months of age who are exclusively breastfed ⁸⁶	Captures the desired practice for the entire population of interest (i.e., all children age 0-5 months should be exclusively breastfed) in a 24-hour period. It does not represent the proportion of infants who are exclusively breastfed every day from birth until they are 6 months of age and should not be interpreted as such.	TC.7.3
Introduce solid, semi-solid and soft foods at the age of 6 months	Introduction of solid, semi-solid or soft foods (age 6-8 months) Percentage of infants age 6-8 months who received solid, semi-solid or soft foods during the previous day	Captures the desired practice for the entire population of interest (i.e., all children age 6-8 months should eat solids) in a 24-hour period. It does not represent the proportion of infants who began receiving solids when they turned 6 months nor the proportion of children age 6-8 months who received solids every day since they turned 6 months of age and should not be interpreted as such.	TC.7.6
Continue frequent, on-demand breastfeeding for two years and beyond	Continued breastfeeding at 1 year and 2 years Percentage of children age 12-15 months (1 year) and 20-23 months (2 years) who received breast milk during the previous day	Captures the desired practice for different populations of interest (children should be breastfed for up to 2 years) in a 24-hour period. However, the label of 1 and 2 years can be confusing given the actual age range in months for each indicator.	TC.7.3
Provide meals with appropriate frequency and energy density	Minimum meal frequency (age 6–23 months) <u>Breastfed children:</u> Depending on age, at least two or three meals/snacks provided during the previous day <u>Non-breastfed children:</u> At least four meals/snacks <u>and/or milk feeds</u> provided during the previous day	This indicator represents the minimum number of meals and not adequacy. In addition, standard questionnaires do not distinguish if milk feeds were provided as part of a solid meal or as a separate meal. Meals may therefore be double counted for some non-breastfed children. Rates should not be compared between breastfed and non-breastfed children.	TC.7.7
Provide foods with appropriate nutrient content	Minimum dietary diversity (age 6–23 months) At least five of eight food groups ⁸⁷ consumed in the 24 hours preceding the survey	This indicator represents the minimum dietary diversity and not adequacy. In addition, consumption of any amount of food from each food group is sufficient to "count" as the standard indicator is only meant to capture yes/no responses. Rates should not be compared between breastfed and non-breastfed children.	TC.7.7
Provide an appropriate amount of food	No standard indicator exists		na
Provide food with appropriate consistency	No standard indicator exists		na
Use of vitamin-mineral supplements or fortified products	No standard indicator exists		na
Safe preparation and storage of foods	While it was not possible to develop indicators to fully capture guidance, one indicator does cover part of the principle: Not feeding with a bottle with a nipple		TC.7.8
Responsive feeding	No standard indicator exists		na

84. It should be noted that these indicators are, in general, proximate measures which do not capture the exact recommendations or guidelines, but serve as a basis for monitoring, providing useful information on the population of interest.

85. For all indicators other than early initiation of breastfeeding, the definition is based on current status, that is, what happened during the day before the survey from the time when the child woke up to the time when he/she went to sleep until the morning of the day of the interview.

86. Infants receiving breast milk, and not receiving any other fluids or foods, with the exception of oral rehydration solution, vitamins, mineral supplements and medicines.

87. The indicator is based on consumption of any amount of food from at least 5 out of the 8 following food groups: 1) Breastmilk, 2) grains, roots and tubers, 3) legumes and nuts, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry and liver/organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables

In addition to the indicators in the table above, three dimensions of complementary feeding are combined to form a composite indicator of “minimum acceptable diet”. This indicator assesses energy needs and nutrient adequacy (apart from iron). To have a minimum acceptable diet, a child must have received in the previous day:

- (i) The appropriate number of meals/snacks/milk feeds;
- (ii) Food items from at least 5 out of 8 food groups for breastfed children; and 4 out of 7⁸⁸ food groups for non-breastfed children; and
- (iii) At least two milk feeds for non-breastfed children.

Table TC.7.1 is based on mothers’ reports of when their last-born child, born in the last two years, was first put to the breast. It indicates the proportion who were ever breastfed, as well as those who were first breastfed within one hour and one day of birth. Table TC.7.2 presents information about liquids or other items newborns were given in the first 3 days of life, apart from breastmilk. The data are disaggregated by various background characteristics, including whether the child was ever breastfed or not.

The set of infant and young child feeding indicators reported in tables TC.7.3 through TC.7.6 are based on the mother’s report of consumption of food and liquids during the day or night prior to being interviewed. Data are subject to a number of limitations, some related to the respondent’s ability to provide a full report on the child’s liquid and food intake due to recall errors, as well as lack of knowledge in cases where the child was fed by other individuals.

In Table TC.7.3, breastfeeding status is presented for exclusively breastfed infants age 0–5 months (i.e. those who receive only breastmilk) and predominantly breastfed infants age 0–5 months (i.e. those who receive breastmilk in addition to plain water and/or non-milk liquids). The table also shows continued breastfeeding of children age 12–15 months and age 20–23 months.

Table TC.7.4 shows the median duration of any breastfeeding among children age 0–35 months and the median duration of exclusive breastfeeding and predominant breastfeeding among children age 0–23 months.

The age-appropriateness of breastfeeding practices for children under the age of 24 months is provided in Table TC.7.5. Different feeding criteria are used

88. Note that the denominator becomes 7 food groups for non-breastfed children in the composite indicator as the milk products group is removed from diet diversity, as this is assessed separately.

depending on the age of the child. For infants age 0–5 months, exclusive breastfeeding is considered age-appropriate feeding, while children age 6–23 months are considered appropriately fed if they are receiving breastmilk and solid, semi-solid or soft foods.

Table TC.7.6 further looks into the introduction of solid, semi-solid, or soft foods for infants age 6–8 months, while Table TC.7.7 presents the percentage of children age 6–23 months who received the minimum number and diversity of meals/snacks during the previous day (referring to solid, semi-solid, or soft food, but also milk feeds for non-breastfed children), by breastfeeding status.

The continued practice of bottle-feeding is a concern because of the potential for contamination if the bottle and/or nipple are not properly cleaned or sterilized. Bottle-feeding can also hinder breastfeeding due to nipple confusion, especially at the youngest ages.⁸⁹ Table TC.7.8 presents the percentage of children aged 0–23 months who were bottle-fed with a nipple during the previous day.

89. Zimmerman, E. and K. Thompson. "Clarifying Nipple confusion." *J Perinatol* 35, no.11 (2015):895-9. doi: 10.1038/jp.2015.83.

7.8

EARLY CHILDHOOD
DEVELOPMENT

It is well recognized that a period of rapid brain development occurs in the first years of life, and the quality of children's home environment and their interactions with caregivers is a major determinant of their development during this period.⁹⁰ Children's early experiences with responsive caregiving serves an important neurological function and these interactions can boost cognitive, physical, social and emotional development.⁹¹ In this context, engagement of adults in activities with children, presence of books and playthings in the home for the child, and the conditions of care are important indicators.

Information on a number of activities that provide children with early stimulation and responsive care was collected in the survey and presented in Table TC.10.1. These included the involvement of adult members of the household with children in the following activities: reading books or looking at picture books, telling stories, singing songs, taking children outside the home, compound or yard, playing with children, and spending time with children naming, counting, or drawing things. It should be noted that the questionnaire module did

not cover activities that children engage in with adults that are not members of the household, even if such frequently or even daily are taking care of the children.

Exposure to books in early years not only provides children with greater understanding of the nature of print but may also give them opportunities to see others reading, such as older siblings doing schoolwork. Presence of books is important for later school performance. The mothers/caretakers of all children under 5 were asked about the number of children's books or picture books they have for the child, and the types of playthings that are available at home. The findings are presented in Table TC.10.2.

Some research has found that leaving children without adequate supervision is a risk factor for unintentional injuries.⁹² In MICS, two questions were asked to find out whether children age 0-59 months were left alone during the week preceding the interview, and whether children were left in the care of other children under 10 years of age. This is presented in Table TC.10.3.

7.9

EARLY CHILDHOOD DEVELOPMENT INDEX 2030 (ECDI2030)

Early childhood development is multidimensional and involves an ordered progression of motor, cognitive, language, socio-emotional and regulatory skills and capacities across the first few years of life.⁹³ Physical growth, literacy and numeracy skills, socio-emotional development and readiness to learn are vital domains of a child's overall development, which build the foundation for later life and set the trajectory for health, learning and well-being.⁹⁴

A 10-item module was used to calculate the Early Child Development Index (ECDI). The primary purpose of the ECDI is to inform public policy regarding the developmental status of children in Trinidad and Tobago. The index is based on selected milestones that children are expected to achieve by ages 3 and 4. The 10 items are used to determine if children are developmentally on track in four domains:

- Literacy-numeracy: Children are identified as being developmentally on track based on whether they can identify/name at least ten letters of the alphabet, whether they can read at least four simple, popular words, and whether they know the name and recognize the symbols of all numbers from 1 to 10. If at least two of these are true, then the child is considered

developmentally on track.

- Physical: If the child can pick up a small object with two fingers, like a stick or a rock from the ground and/or the mother/caretaker does not indicate that the child is sometimes too sick to play, then the child is regarded as being developmentally on track in the physical domain.
- Social-emotional: Children are considered to be developmentally on track if two of the following are true: If the child gets along well with other children, if the child does not kick, bite, or hit other children and if the child does not get distracted easily.
- Learning: If the child follows simple directions on how to do something correctly and/or when given something to do, is able to do it independently, then the child is considered to be developmentally on track in this domain.

ECDI is then calculated as the percentage of children who are developmentally on track in at least three of these four domains. The findings are presented in Table TC.11.1.

8.1

EARLY CHILDHOOD EDUCATION

Readiness of children for primary school can be improved through attendance to early childhood education programmes or through pre-school. Early childhood education programmes include programmes for children that have organised learning components as opposed to baby-sitting and day-care which do not typically have organised education and learning.

Early Childhood Care and Education is the first phase of the seamless education system in Trinidad and Tobago and targets children aged three (3) to four (4) years.⁹⁵ Its members work to coordinate, develop and manage ECCE programmes that are developmentally appropriate, and promote the holistic development of young children, thus laying the foundation for lifelong learning.

The Early Childhood Care and Education (ECCE) Division of the Ministry of Education has the overall responsibility for leadership, governance and

management of the ECCE sector throughout Trinidad, and in collaboration with The Division of Education, Youth Affairs and Sport for ECCE Centres in Tobago.

This ECCE Division is responsible for:

- Programming, coordinating and monitoring ECCE activities in the field.
- Monitoring delivery of the ECCE Programme in all ECCE Centres throughout Trinidad and Tobago.
- Advising agencies involved, on the proper implementation of the programme.
- Monitoring the physical conditions of all ECCE Centres and making recommendation to respective agencies for improvement.
- Providing professional advice where needed in the system.

There are presently one hundred and thirty-eight (138) fully operational Government and Government Assisted ECCE centres throughout Trinidad and Tobago, sixty-three (63) SERVOL managed centres and six hundred and ninety-one (691) privately run

95. Ministry of Education <https://www.moe.gov.tt/ecce-division/>

ECCE centres. Each of the seven districts is supervised by a District Cluster Administrator while the Core Management Team at the ECCE Division is charged with core functions to oversee the entire sector.

While there is an overall absence of specific legislation to deal with the regulation of early childhood centres in Trinidad and Tobago, the Ministry of Education is in the process of amending the Education Act Chap. 39:01. to include ECCE services. It is expected that this amendment will be finalized by the year's end.

Table LN.1.1 shows the percent of children age 3 and 4 years currently attending early childhood education. A child currently attending school is a child who regularly attends school at the time of the survey. If the child is not attending school at the time of the interview due to school holidays or breaks, but the child regularly attends school, the child is considered as currently attending school. This indicator is based on question UB8 in the Questionnaire for Children Under 5.

Table LN.1.2 looks at children's exposure to organised learning programmes in the year before

the official primary entry age. The official primary school entry age in Trinidad and Tobago is age 5 years. Table LN.1.2 therefore refers to children who were 4 years old at the beginning of the school year.⁹⁶ In Trinidad and Tobago, the school year begins in September.

The indicator corresponds to SDG indicator 4.2.2: Participation rate in organized learning (one year before the official primary entry age) and is calculated as an adjusted⁹⁷ net attendance rate (ANAR). This indicator is based on question UB7 in the Questionnaire for Children Under 5.

Additionally, Table LN.1.2 presents the gender, wealth and area parity indices for SDG indicator 4.2.2. These indices contribute to SDG indicator 4.5.1: Parity indices (female/male, rural/urban, bottom/top wealth quintile and others such as disability status as data become available) for all education indicators that can be disaggregated. Generally, when a parity index value falls between 0.97 and 1.03, it is regarded as parity between two groups. The likely more disadvantaged group (e.g., female, poor and rural) is placed in the numerator, so parity index values below 0.97 indicate disadvantage for those groups. For example, in the

96. In MICS, the age of household members is the age at the time of the survey. This determines eligibility for individual questionnaires, modules and questions. Age is also used to define indicators. However, in analysis of the majority of education-related indicators based on the age of children, e.g., adjusted net attendance rates, completion rates, etc., a variable is created to reflect the age at the beginning of the school year. This eliminates issues relating to the timing and length of survey fieldwork and creates comparable findings across countries, while taking age-criteria for enrolment into account. Tables in this chapter specifically mention "Age at beginning of school year" in rows and columns where applicable, as compared to simply "age" in reference to age at the time of the survey.

97. Rates presented in this table are "adjusted" since the numerator includes children one year younger than the official primary entry age attending either ECE or primary education.

gender parity index (GPI), a value between 0.97 and 1.03 indicates parity between the sexes, a GPI value lower than 0.97 indicates female disadvantage and a value greater than 1.03 suggests male disadvantage. The further from 1.00 that a parity index lies, the greater the disparity between groups. The indices do not reveal the overall indicator levels, as parity may be achieved, while overall levels for both groups are low.

Parity indices are also presented in Table LN.2.8 (for attendance to primary, lower and upper secondary school) and in Tables LN.4.1 and LN.4.2 (for reading and numeracy skills, respectively).

ATTENDANCE

Ensuring that all girls and boys complete primary and secondary education is a target of the 2030 Agenda for Sustainable Development. Education is a vital prerequisite for combating poverty, empowering women, economic growth, protecting children from hazardous and exploitative labour and sexual exploitation, promoting human rights and democracy, protecting the environment, and influencing population growth.

In Trinidad and Tobago, children enter primary school at age 5, lower secondary at age 12 and upper secondary school at age 15. There are 7 grades in primary school and 5 grades in secondary school. In primary school, the first two grades are referred to as Infants 1 to 2 and then the other five as Standards 1 to 5. For lower secondary school, grades are

referred to as Form 1 to 3 and in upper secondary to Form 4 to 5. The school year typically runs from September of one year to July of the following year.

To achieve comparability between varying national educational systems and classifications across the world, the United Nations Educational, Scientific and Cultural Organization (UNESCO) maintains the International Standard Classification of Education (ISCED) statistical framework. Its defined levels and coding are used in computation of MICS Indicators.⁹⁸ With focus on completion of primary and secondary education, indicators are centred on levels 0-3 presented in the table of classifications below.

ISCED 2011		Education system in Trinidad and Tobago
Level	ISCED Name	Name of education level in: English
0	Early childhood care and education	Pre-primary education
1	Primary	Primary school
2	Lower secondary	Lower secondary
3	Upper secondary	Upper secondary
The post-secondary levels are not detailed in this table, but include 4: 6th Form, 5: Bachelor's, 6: Master's/PH.D		

98. ISCED is periodically revised by UNESCO (latest in 2011) in consultation with countries. National ISCED mappings are published here: <http://uis.unesco.org/en/isced-mappings>.

Attendance to pre-primary education is important for the readiness of children to school. Table LN.2.1 shows the proportion of children in the first grade of primary school (regardless of age) who attended an early childhood education programme the previous year.⁹⁹

Table LN.2.2 presents the percentage of children of primary school entry age entering Primary Infant 1.

Table LN.2.3 provides the percentage of children of primary school age (5 to 11 years) who are attending primary or secondary school¹⁰⁰, and those who are out of school. Similarly, Table LN.2.4 presents the percentage of children of lower secondary school age (age 12 to 14 years) who are attending lower secondary school or higher education levels¹⁰¹, and those who are out of school.

In Table LN.2.5, children are distributed according to their age against current grade of attendance (age-for-grade). For example, an 8-year-old child (at the beginning of the school year) is expected to be in Standard 2, as per the official intended age-for-grade. If this child is currently in Primary Infant 2, he/she will be classified over-age by 2 years. The table includes both primary and lower secondary levels.

Table LN.2.6 presents the percentage of children of upper secondary school age (age 15 to 17 years) who are attending upper secondary school or higher¹⁰², and those who are out of school.

The gross intake ratio to the last grade of primary school, primary school completion rate and transition rate to secondary education are presented in Table LN.2.7. The gross intake ratio is the ratio of the total number of students, regardless of age, entering the last grade of primary school for the first time, to the number of children of the primary graduation age at the beginning of the current (or most recent) school year.

The completion rate of primary education refers to the percentage of a cohort of children age 3 to 5 years above the official intended age for the last grade of primary education who have completed primary education. The intended age for the last grade of primary is the age at which children would enter the last grade of primary school if they had started school at the official primary entry age and had progressed without repeating or skipping a grade. In Trinidad and Tobago, the official age of entry into primary school is age 5 years. With 7 grades in primary school, the intended age for the last grade of primary is therefore 11 years, and the

99. The computation of the indicator does not exclude repeaters, and therefore is inclusive of both children who are attending primary school for the first time, as well as those who were in the first grade of primary school the previous school year and are repeating. Children repeating may have attended pre-primary education prior to the school year during which they attended the first grade of primary school for the first time; these children are not captured in the numerator of the indicator.

100. Rates presented in this table are "adjusted" since they include not only primary school attendance, but also lower and upper secondary school attendance in the numerator.

101. Rates presented in this table are "adjusted" since they include not only lower secondary school attendance, but also attendance to higher education levels in the numerator.

102. Rates presented in this table are "adjusted" since they include not only upper secondary school attendance, but also attendance to higher education levels in the numerator.

reference group for the completion rate of primary education is children age 14 to 16 years. Completion rates are also presented for lower and upper secondary education. The official intended age for the last grades of lower and upper secondary school are 14 and 17 years, respectively. Thus, denominators for the lower and upper secondary completion rates are children age 17 to 19 years and children age 20 to 22 years, respectively.

The table also provides the “effective” transition rate¹⁰³, defined as the percentage of children who continued to the next level of education – the number of children who are attending the first grade of the higher education level in the current school year and were in the last grade of the lower education level the previous year divided by the number of children who were in the last grade of the lower education level the previous school year and are not repeating that grade in the current year.

A low effective transition rate indicates that a low percentage of students are transitioning to the next level of education. This brings to light the existence of potential barriers in an education system including: financial burden such as enrolment fees or the obligation to purchase textbooks or school uniforms; education supply and quality issues such as a limited number of teachers or classrooms and

low-quality teaching; as well as social and individual beliefs on education such as low expectation in returns of advancing in education.

Table LN.2.8 presents the gender parity indices for the adjusted primary and secondary net attendance rates provided in Tables LN.2.3, LN.2.4 and LN.2.6. It also presents additional parity indices contributing to SDG 4.5.1, as described for Table LN.1.2.

Specifically, the orphanhood parity index accommodates the need for continuing presentation of data related to the previous MDG indicator 6.4. It should be noted that this indicator was measured on the age group of 10-14 years alone, whereas this replacing measure is on attendance for each of the three levels of education presented.

103. The simple transition rate, which is no longer calculated in MICS, tends to underestimate pupils' progression to secondary school as it assumes that the repeaters never reach secondary school.

8.3

PARENTAL INVOLVEMENT

Parental involvement in their children's education is widely accepted to have a positive effect on their child's learning performance. For instance, reading activities at home have significant positive influences on reading achievement, language comprehension and expressive language skills.¹⁰⁴ Research also shows that parental involvement in their child's literacy practices is a positive long-term predictor of later educational attainment.¹⁰⁵

Beyond learning activities at home, parental involvement that occurs in school (like participating in school meetings, talking with teachers, attending school meetings and volunteering in schools) can also benefit a student's performance.¹⁰⁶ Research studies have shown that, in the primary school age range, the impact of parental involvement in school activities can even be much bigger than differences associated with variations in the quality of schools, regardless of social class and ethnic group.¹⁰⁷

The PR module included in the Questionnaire for children age 5-17 years was developed and tested

for inclusion in MICS6. The work is described in detail in MICS Methodological Papers, No. 5.¹⁰⁸

Table LN.3.1 presents percentages of children age 7-14 years for whom an adult household member received a report card and was involved in school management and school activities in the last year, including discussion with teachers on children's progress.

In Table LN.3.2 reasons for children unable to attend class due to a school-related reasons are presented. Reasons include natural and man-made disaster, teacher strike and teacher absenteeism.

Lastly, Table LN.3.3 shows learning environment at home, i.e., percentage of children with 3 or more books to read, percentage of children who have homework, percentage whose teachers teach in the language that the child speaks at home, and percentage of children who receive help with homework.

¹ MICS indicator LN.12 - Availability of information on children's school performance

² MICS indicator LN.13 - Opportunity to participate in school management

³ MICS indicator LN.14 - Participation in school management

⁴ MICS indicator LN.15 - Effective participation in school management

⁵ MICS indicator LN.16 - Discussion with teachers regarding children's progress

^A As eligibility for the Parental Involvement and Foundational Learning Skills modules was determined based on age at time of interview (age 7-14 years), the disaggregate of Age at beginning of school year inevitably presents children who were age 6 years at the beginning of the school year.

^B Attendance to school here is not directly comparable to adjusted net attendance rates reported in preceding tables, which utilise information on all children in the sample. This and subsequent tables present results of the Parental Involvement and Foundational Learning Skills modules administered to mothers or caretakers of a randomly selected subsample of children age 7-14 years.

^C School management sector was collected for children attending primary education or higher. Children out of school or attending ECCE are not shown.

8.4

FOUNDATIONAL LEARNING SKILLS

The ability to read and understand a simple text is one of the most fundamental skills a child can learn. Yet in many countries, students enrolled in school for as many as 6 years are unable to read and understand simple texts, as shown for instance by regional assessments such as the Latin American Laboratory for Assessment of the Quality of Education (LLECE), the Analysis Programme of the CONFEMEN Education Systems (PASEC) and the Southern and Eastern Africa Consortium for Monitoring Educational Quality (SACMEQ).¹⁰⁹ Acquiring literacy in the early grades of primary is crucial because doing so becomes more difficult in later grades, for those who are lagging behind.¹¹⁰

A strong foundation in basic numeracy skills during the early grades is crucial for success in mathematics in the later years. Mathematics is a skill very much in demand and most competitive jobs require some level of skill in mathematics. Early mathematical knowledge is a primary predictor of later academic

achievement and future success in mathematics is related to an early and strong conceptual foundation.¹¹¹

There are a number of existing tools for measuring learning outcomes¹¹² with each approach having their own strengths and limitations as well as varying levels of applicability to household surveys such as MICS. For some international assessments, it may just be too late: “Even though international testing programs like PISA and TIMSS are steadily increasing their coverage to also cover developing countries, (...) much of the divergence in test scores happens before the points in the educational trajectories of children where they are tested by international assessments”, according to longitudinal surveys like the Young Lives Study.¹¹³ National assessments such as the Early Grade Reading Assessment, which happens earlier and is more context specific, will however be less appropriate for cross-country analysis; although it

may be possible to compare children who do not complete an exercise (zero scores) set at a level which reflects each national target for children by a certain age or grade. Additionally, it is recognised that some assessments only capture children in school. However, given that many children do not attend school, further data on these out-of-school children is needed and these can be adequately captured in household surveys.

The MICS Foundational Learning Skills module is designed to measure basic reading and numeracy skills expected upon completion of second grade of primary education.

The reading skills assessment is based on a short story and five comprehension questions (three literal and two inferential). The rationale, development, testing and validation of this module has been documented in two MICS Methodological Papers, No. 5¹⁰⁵ and No. 9¹¹⁴.

In Trinidad and Tobago 2022 MICS, reading assessments were available only in English. The assessment tools were customised using the official Grade 2 (Standard 2) textbooks for these languages, ensuring that the vocabulary was appropriate for Grade 2 learners, both in terms of complexity and cultural relevance.¹¹⁵

The numeracy skills assessment is based on universal skills expected at Grade 2 level. The tool includes four mathematics tasks: number reading, number discrimination, addition and pattern recognition.

Tables LN.4.1 and LN.4.2 present percentages of children age 7-14 years, by sex, who correctly answered foundational reading tasks and numeracy skills, respectively. Age and school attendance, by level and grade are among the disaggregates shown and necessary to read some of the reported indicators. These MICS indicators are designed and developed to both inform national policy development and report on global SDG indicator 4.1.1(a): Proportion of children in grade 2/3 achieving a minimum proficiency in (i) reading and (ii) mathematics by sex.

The assessment score of reading tasks is further disaggregated by results of the literal questions and inferential questions. The disaggregation of numeracy skills such as number reading, number discrimination, addition and pattern recognitions are also available.

BIRTH REGISTRATION

A name and nationality is every child's right, enshrined in the Convention on the Rights of the Child (CRC) and other international treaties. Registering children at birth is the first step in securing their recognition before the law, safeguarding their rights, and ensuring that any violation of these rights does not go unnoticed.¹¹⁶

Birth certificates are proof of registration and the first form of legal identity and are often required to access health care or education. Having legal identification can also be one form of protection from entering into marriage or the labour market, or being conscripted into the armed forces, before the legal age. Birth registration and certification is also legal proof of one's place of birth and family ties and thus necessary to obtain a passport. In adulthood, birth certificates may be required to obtain social assistance or a job in the formal sector, to buy or inherit property and to vote.

The Civil Registry of the Registrar General ensures that the island's most vital occurrences are recorded. In order to register a birth, information must be provided to the District Registrar located nearest to where child was born within three (3) months of birth of child, along with the required documentation

- ID of informant.
- Letter/card from Hospital.
- Birth certificate of parents.
- If parents are married, marriage certificate should be presented.

A birth registration is therefore considered late when it takes place after three (3) months of birth and attracts a fee for the service.

Births registered after three months of birth but before one (1) year require the following in addition to the above:

- child immunization card
- current affidavits

116. UNICEF. Every Child's Birth Right: Inequities and trends in birth registration. New York: UNICEF, 2013. https://www.unicef.org/publications/files/Birth_Registration_11_Dec_13.pdf.

However, for Late Registration of Birth (after one year), considerably more documentation is needed as per the following

If the birth took place at the hospital:-

- Letter from hospital stating date of birth of child and name of parent.
- Statutory declaration from applicant giving particulars of birth and reason for non-registration of same.
- Immunization card.
- Letter from school first attended.
- Birth certificate(s) of child/ children born before or after birth to be registered.
- If parents are married, marriage certificate should be presented.

If the birth took place at home:-

- Immunization card.
- If parents are married, marriage certificate should be presented.
- Birth certificates of all children before and after birth to be registered.
- Identification of applicant.
- Letter from school stating the date of birth given at time of entry to school.
- Baptismal certificate (where applicable).
- Affidavit from mother/father or person having charge of child stating reason for non-registration of the birth.
- Affidavit from a person present at birth e.g. aunt, grandmother, midwife.
- Affidavit from prominent person in the area where child was born, e.g. Doctor, Lawyer, Teacher, Priest, Pundit, Police Officer.

9.2

CHILD DISCIPLINE

Teaching children self-control and acceptable behaviour is an integral part of child discipline in all cultures. Positive parenting practices involve providing guidance on how to handle emotions or conflicts in manners that encourage judgment and responsibility and preserve children's self-esteem, physical and psychological integrity and dignity. Too often however, children are raised using punitive methods that rely on the use of physical force or verbal intimidation to obtain desired behaviours. Studies¹¹⁷ have found that exposing children to violent discipline has harmful consequences, which range from immediate impacts to long-term harm that children carry forward into adult life. Violence hampers children's development, learning abilities and school performance; it inhibits positive relationships, provokes low self-esteem, emotional distress and

depression; and, at times, it leads to risk taking and self-harm.

In the Trinidad and Tobago 2022 MICS, mothers or caretakers of children under age five and of one randomly selected child aged 5-17 were asked a series of questions on the methods adults in the household used to discipline the child during the past month and if the respondent believes that physical punishment is a necessary part of child-rearing. Tables PR.2.1 and PR.2.2 present the results.

9.3

CHILD LABOUR

Children around the world are routinely engaged in paid and unpaid forms of work that are not harmful to them. However, they are classified as child labourers when they are either too young to work or are involved in hazardous activities that may compromise their physical, mental, social or educational development. Article 32 (1) of the CRC states: “States Parties recognize the right of the child to be protected from economic exploitation and from performing any work that is likely to be hazardous or to interfere with the child’s education, or to be harmful to the child’s health or physical, mental, spiritual, moral or social development”.

Currently, Trinidad and Tobago does not have legislation or policies directly addressing the issue of child labour. However, a child under the age of sixteen years shall not be employed or work in any public or private undertaking, or in any branch thereof, other than an undertaking owned and controlled by members of the same family.¹¹⁸

The child labour module was administered for one randomly selected child age 5-17 years in each

household and includes questions on the type of work a child does and the number of hours he or she is engaged in it. Data are collected on both economic activities (paid or unpaid work for someone who is not a member of the household, work for a family farm or business) and domestic work (household chores such as cooking, cleaning or caring for children, as well as collecting firewood or fetching water).^{119,120,121}

Table PR.3.1 presents children’s involvement in economic activities. The methodology of the MICS Indicator on Child labour uses three age-specific thresholds for the number of hours children can perform economic activity without being classified as child labourers. A child that performed economic activities during the last week for more than the age-specific number of hours is classified as in child labour:

- i. age 5-11: 1 hour or more
- ii. age 12-14: 14 hours or more
- iii. age 15-17: 43 hours or more

118. Trinidad and Tobago Children Act, 2012

119. ‘Own use production of goods’, including activities such as fetching water and collecting firewood, falls within the production boundary set by the United Nations System of National Accounts. However, for the purpose of SDG reporting of indicator 8.7.1, and with the goal of facilitating international comparability, fetching water and collecting firewood have been classified as unpaid household services (i.e., household chores), a form of production that lies outside the production boundary.

120. UNICEF. How Sensitive Are Estimates of Child Labour to Definitions? MICS Methodological Paper No. 1. New York: UNICEF, 2012. https://data.unicef.org/wp-content/uploads/2015/12/Child_Labour_Paper_No.1_FINAL_162.pdf.

121. The Child Labour module was administered in the Questionnaire for Children Age 5-17 (See Appendix E: Questionnaires). In households with at least one child age 5-17, one child was randomly selected. To account for the random selection, the household sample weight is multiplied by the total number of children age 5-17 in each household; this weight is used when producing the relevant tables.

Table PR.3.2 presents children’s involvement in household chores. As for economic activity above, the methodology also uses age-specific thresholds for the number of hours children can perform household chores without being classified as child labourers. A child that performed household chores during the last week for more than the age-specific number of hours is classified as in child labour.¹²²

- i. age 5-11 and age 12-14: 21 hours or more
- ii. age 15-17: No limit to number of hours

SDG Target 8.7 aims to “take immediate and effective measures to eradicate forced labour, end modern slavery and human trafficking and secure the prohibition and elimination of the worst forms of child labour, including recruitment and use of child soldiers, and by 2025 end child labour in all its forms.” The SDG indicator 8.7.1 provides the proportion of children aged 5-17 years who are engaged in child labour. Two measures of the indicator are presently in use, the first based on the production boundary set by the United Nations System of National Accounts (using above age-thresholds on economic activities alone) and the second based on the general production boundary (classifying as child labour if age-specific thresholds are exceeded on either or both economic activities

or household chores). Table PR.3.3 presents both of these two measures. The MICS Indicator PR.3 is based on the second, i.e. using the general production boundary.

Pertaining to the overall concept of child labour, the module also collects information on hazardous working conditions. Table PR.3.4 presents the percentage of children involved in each of the hazardous activities included in the survey. Note, however, that the present definition, also used for SDG reporting, does not include involvement in hazardous working conditions, as further methodological work is needed to validate questions specifically aimed at identifying children working under such hazardous conditions.

122. Note that the age-specific thresholds for household chores have changed during the implementation of the sixth round of MICS. Comparison to other data sources, including previous MICS surveys, should be done with caution.

^a The definition of child labour used for SDG reporting does not include hazardous working conditions. This is a change over previously defined MICS6 indicator. This column presents a definition comparable to the previous indicator. The SDG indicator is presented in Table PR.3.3.

^b Includes attendance to early childhood education

^c The disaggregate of Mother's education is not available for children age 15-17 years identified as emancipated.

9.4

CHILD MARRIAGE

Marriage¹²³ before the age of 18 is violation of human rights, yet remains a reality for many children. The right to ‘free and full’ consent to a marriage is recognized in the Universal Declaration of Human Rights - with the recognition that consent cannot be ‘free and full’ when one of the parties involved is not sufficiently mature to make an informed decision about a life partner. In the Sustainable Development Goals, child marriage has been identified as a harmful practice which the world should aim to eliminate by 2030.

Child marriage is more common among girls than boys, but does occur around the world among children of both sexes. In many parts of the world parents encourage the marriage of their daughters while they are still children in hopes that the marriage will benefit them both financially and socially, while also relieving financial burdens on the family. In actual fact, child marriage compromises

the development of girls and often results in early pregnancy and social isolation, with little education and poor vocational training reinforcing the gendered nature of poverty.¹²⁴

Closely related to the issue of child marriage is the age at which sexual activity – and for females, childbearing – may begin. Women who were married before the age of 18 tend to have more children than those who marry later in life and are less likely to receive maternal health care services.^{125,126} In addition, pregnancy related deaths are known to be a leading cause of mortality for both married and unmarried girls between the ages of 15 and 19.

Table PR.4.1W presents the percentage of women married before ages 15 and 18 years, the percentage of adolescent girls age 15-19 years who are currently married, and the percentage of women in a polygynous union.

123. All references to marriage in this chapter include cohabiting unions as well.

Table PR.4.2W presents the proportion of women who were first married or entered into a marital union before age 15 and 18 by area and age groups. Examining the percentages married before ages 15 and 18 across different age groups allow for trends to be observed in child marriage over time.

Another component is the spousal age difference with the indicator being the percentage of married/in union women 10 or more years younger than their current spouse. Table PR.4.3 presents the results of the age difference between women and their husband or partner.

Table PR.4.1W: Child marriage and polygyny

Percentage of women age 15-49 years who first married or entered a marital union before their 15th birthday, percentages of women age 20-49 and 20-24 years who first married or entered a marital union before their 15th and 18th birthdays, percentage of women age 15-19 years currently married or in union, and the percentage of women who are in a polygynous marriage or union, Trinidad and Tobago, 2022

VICTIMISATION

Crime can have a large impact on the lives of victims and the wider community in which they live. Those who are victims of crimes can suffer physically and psychologically and experience loss of assets and income. Crime can also carry significant economic costs to the community through the provision of preventative measures as well as corrective services¹²⁷.

Table PR.6.1W presents the percentage of who were victims of robbery or assault in the last 3 and 1 year prior to the survey, by various background characteristics. Table PR.6.2W shows if weapons (namely, knife, gun or other weapons) were used

during the last robbery. Table PR.6.3W expands on the circumstances of the latest assault, indicating where it took place and type of weapon used. Finally, Table P.R6.4W indicates if the last robbery or assault experienced by women was reported to the police.

127. United Nations Office on Drugs and Crime, and United Nations Economic Commission for Europe. Manual on Victimization Surveys. Geneva: UN. https://www.unodc.org/documents/data-and-analysis/Crime-statistics/Manual_on_Victimization_surveys_2009_web.pdf.

¹ MICS indicator PR.13 - Crime reporting; SDG indicator 16.3.1

^A This indicator is constructed using both last incidents of robbery and assault, as respondents may have experienced 1) no incident, 2) one last incident of either robbery or assault or 3) both robbery and assault.

9.6

FEELINGS OF SAFETY

Questions about fear, such as feelings of safety and perceptions of crime as a problem, indicate respondents' level of perceived safety in everyday life. This is important as such perceptions limit people's freedom of movement and influence how they manage threats to their safety¹²⁵

Table PR.7.1W presents data for women on their feelings of safety for walking alone in their neighbourhood after dark and for being at home alone after dark.

Table PR.7.1W: Feelings of safety

Percent distribution of women age 15-49 years by feeling of safety walking alone in their neighbourhood after dark and being home alone after dark, Trinidad and Tobago, 2022																
	Percent distribution of women who walking alone in their neighbourhood after dark feel:						Percentage of women who feel safe walking alone in their neighbourhood after dark ¹	Percent distribution of women who being home alone after dark feel:					Percentage of women who feel safe home alone after dark	Percentage of women who after dark feel very unsafe walking alone in their neighbourhood or being home alone	Number of women	
	Very safe	Safe	Unsafe	Very unsafe	Never walk alone after dark	Total		Very safe	Safe	Unsafe	Very unsafe	Never home alone after dark				Total

10.1

DRINKING WATER

Access to safe drinking water, sanitation and hygiene (WASH) is essential for good health, welfare and productivity and is widely recognised as a human right¹²⁸. Inadequate WASH is primarily responsible for the transmission of diseases such as cholera, diarrhoea, dysentery, hepatitis A, typhoid and polio. Diarrhoeal diseases exacerbate malnutrition and remain a leading global cause of child deaths.

Drinking water may be contaminated with human or animal faeces containing pathogens, or with chemical and physical contaminants with harmful effects on child health and development. While improving water quality is critical to prevent disease, improving the accessibility and availability of drinking water is equally important, particularly for women and girls who usually bear the primary

responsibility for carrying water, often for long distances.¹²⁹

The SDG targets relating to drinking water are much more ambitious than the MDGs and variously aim to achieve universal access to basic services (SDG 1.4) and universal access to safely managed services (SDG 6.1). For more information on global targets and indicators please visit the website of the WHO/UNICEF Joint Monitoring Programme for Water Supply, Sanitation and Hygiene.¹³⁰

The distribution of the population by main source of drinking water is shown in Table WS.1.1. The population using improved sources of drinking water are those using any of the following types of supply: piped water (into dwelling, compound, yard or plot, to neighbour, public tap/standpipe), tube well/borehole, protected dug well, protected spring, rainwater collection, and packaged or delivered water¹³¹.

Table WS 1.2 shows the amount of time taken per round trip to collect water for users of improved and unimproved sources. Household members using improved water sources located on premises or requiring up to and including 30 minutes per trip

128. The human rights to water and sanitation were explicitly recognised by the UN General Assembly and Human Rights Council in 2010 and in 2015.

129. WHO, and UNICEF. Safely Managed Drinking Water: thematic report on drinking water. Geneva: WHO Press, 2017. <https://data.unicef.org/wp-content/uploads/2017/03/safely-managed-drinking-water-JMP-2017-1.pdf>.

130. "Home." JMP. Accessed September 06, 2018. <https://washdata.org/>.

131. Packaged water (bottled water and sachet water) and delivered water (tanker truck and cart with small drum/tank) are treated as improved based in new SDG definition.

for water collection meet the SDG criteria for a 'basic' drinking water service.

Table WS.1.3 presents the sex and age of the household member usually responsible for water collection among household members without water sources on premises. Table WS.1.4 shows the average time spent each day by the household member mainly responsible for collecting drinking water.

Table WS.1.5 shows the proportion of household members with sufficient water available when needed from their main source of drinking water and the main reasons household members are unable to access water in sufficient quantities when needed.

Table WS.1.6 presents the proportion of household members with an indicator of faecal contamination detected in their drinking water source. The risk of faecal contamination is shown based on the number of *Escherichia coli* (*E. coli*) bacteria detected, ranging from low (<1 *E. coli* per 100 mL), to moderate (1-10 *E. coli* per 100 mL), high (11-100 *E. coli* per 100 mL) and very high risk (>100 *E. coli* per 100 mL). Table WS.1.7 shows the proportion of household members with *E. coli* detected in their household

drinking water. Contamination may occur between the source and the household during transport, handling and storage.

Table WS.1.8 shows the proportion of household population with improved and unimproved drinking water sources located on premises, available when needed, and free from contamination. Households with improved sources accessible on premises, with sufficient quantities of water available when needed, and free from contamination meet the SDG criteria for 'safely managed' drinking water services.

Table WS.1.9 presents the main methods by which households report treating water in order to make it safer to drink. Boiling water, adding bleach or chlorine, using a water filter, and using solar disinfection are considered appropriate methods of water.

Table WS.1.1: Use of improved and unimproved water sources

Percent distribution of household population by main source of drinking water and percentage of household population using improved drinking water sources, Trinidad and Tobago, 2022

10.2

HANDWASHING

Handwashing with water and soap is the most cost-effective health intervention to reduce both the incidence of diarrhoea and pneumonia in children under five¹³². It is most effective when done using water and soap after visiting a toilet or cleaning a child, before eating or handling food and before feeding a child. Direct observation of handwashing behaviour at these critical times is challenging. A reliable alternative to observations is assessing the likelihood that correct handwashing behaviour takes place by asking to see the place where people wash their hands and observing whether water and soap (or other local cleansing materials) are available at this place^{133,134}.

Hygiene was omitted from the MDGs but has been included in the SDG targets which aim to achieve universal access to a basic handwashing facility at home (SDG 1.4 and 6.2).

Table WS.2.1 shows the proportion of household members with fixed or mobile handwashing facilities observed on premises (in the dwelling, yard or plot). It also shows the proportion of handwashing facilities where water and soap were observed. Household members with a handwashing facility on premises with soap and water available meet the SDG criteria for a 'basic' handwashing facility.

132. Cairncross, S. and V. Valdmanis. "Water supply, sanitation and hygiene promotion Chapter 41." in Disease Control Priorities in Developing Countries. 2nd Edition, edited by Jameson et al. Washington (DC): The International Bank for Reconstruction and Development / The World Bank.

133. Ram, P. Practical Guidance for Measuring Handwashing Behavior: 2013 Update. Global Scaling Up Handwashing. Washington DC: World Bank Press, 2013.

134. Handwashing place or facilities may be fixed or mobile and include a sink with tap water, buckets with taps, tippy-taps, and jugs or basins designated for handwashing. Soap includes bar soap, liquid soap, powder detergent, and soapy water but does not include ash, soil, sand or other handwashing agents.

Table WS.2.1: Handwashing facility with soap and water on premises

Percent distribution of household members by observation of handwashing facility and percentage of household members by availability of water and soap or detergent at the handwashing facility, Trinidad and Tobago, 2022

	Handwashing facility observed				Total	Number of household members	Handwashing facility observed and		Number of household members where handwashing facility was observed	Percentage of household members with handwashing facility where water and soap are present ¹	Number of household members where handwashing facility was observed or with no handwashing facility in the dwelling, yard, or plot
	Fixed facility observed	Mobile object observed	No handwashing facility observed in the dwelling, yard, or plot	No permission to see/ Other			water available	soap available

10.3

SANITATION

Unsafe management of human excreta and poor personal hygiene are closely associated with diarrhoea as well as parasitic infections, such as soil transmitted helminths (worms). Improved sanitation and hygiene can reduce diarrhoeal disease by more than a third¹³⁵, and can substantially reduce the health impact of soil-transmitted helminth infection and a range of other neglected tropical diseases which affect over 1 billion people worldwide¹³⁶.

The SDG targets relating to sanitation are much more ambitious than the MDGs and variously aim to achieve universal access to basic services (SDG 1.4) and universal access to safely managed services (SDG 6.2).

An improved sanitation facility is defined as one that hygienically separates human excreta from human contact. Improved sanitation facilities include flush or pour flush to piped sewer systems, septic tanks or pit latrines, ventilated improved pit latrines, pit latrines with slabs and composting toilets. Table WS.3.1 shows the population using improved and unimproved sanitation facilities. It also shows the proportion who dispose of faeces in fields, forests, bushes, open water bodies of water,

beaches or other open spaces, or with solid waste, a practice known as ‘open defecation’.

Table WS.3.2 presents the distribution of household population using improved and unimproved sanitation facilities which are private, shared with other households or public facilities. Those using shared or public improved sanitation facilities are classed as having a ‘limited’ service for the purpose of SDG monitoring. Households using improved sanitation facilities that are not shared with other households meet the SDG criteria for a ‘basic’ sanitation service, and may be considered ‘safely managed’ depending on how excreta are managed.

Table WS.3.3 shows the methods used for emptying and removal of excreta from improved pit latrines and septic tanks. Excreta from improved pit latrines and septic tanks that is never emptied (or don’t know if ever emptied) or is emptied and buried in a covered pit is classed as ‘safely disposed in situ’ and meets the SDG criteria for a ‘safely managed’ sanitation service. Excreta from improved pit latrines and septic tanks that is removed by a service provider to treatment may also be safely managed, depending on the type of treatment

135. Cairncross, S. et al. "Water, Sanitation and Hygiene for the Prevention of Diarrhoea." *International Journal of Epidemiology* 39, no. Suppl1 (2010): 193-205. doi:10.1093/ije/dyq035.

Geneva: WHO Press, 2015. http://apps.who.int/iris/bitstream/handle/10665/182735/WHO_FWC_WSH_15.12_eng.pdf;jsessionid=7F7C38216E04E69E7908AB6E8B63318F?sequence=1.

received. Other methods of emptying and removal are not considered 'safely managed'.

Table WS.3.4 summarises the main ways in which excreta is managed from households with improved on-site sanitation systems (improved pit latrines and septic tanks) and compares these with the proportion with sewer connections, unimproved sanitation or practicing open defecation.

Table WS.3.5 shows the main methods used for disposal of child faeces among households with children aged 0-2 years. Appropriate methods for disposing of the stool include the child using a toilet or latrine and putting or rinsing the stool into a toilet or latrine. Putting disposable diapers with solid waste, a very common practice throughout the world, is only considered an appropriate means of disposal if there is also a system in place for

hygienic collection and disposal of the solid waste itself. This classification is currently under review.

The JMP has produced regular estimates of national, regional and global progress on drinking water, sanitation and hygiene (WASH) since 1990. The JMP service 'ladders' enable benchmarking and comparison of progress across countries at different stages of development. As of 2015, updated water and sanitation ladders have been introduced which build on established indicators and establish new rungs with additional criteria relating to service levels. A third ladder has also been introduced for handwashing hygiene¹³⁷. Table WS.3.6 summarises the percentages of household population meeting the SDG criteria for 'basic' drinking water, sanitation and handwashing services.

^AIn many countries, disposal of children's faeces with solid waste is common. The risks vary between and within countries depending on whether solid waste is regularly collected and well managed; therefore, for the purposes of international comparability, solid waste is not considered safely disposed.

10.4

MENSTRUAL HYGIENE

The ability of women and adolescent girls to safely manage their monthly menstrual cycle in privacy and with dignity is fundamental to their health, psychosocial well-being and mobility. Women and girls who lack access to adequate menstrual hygiene management facilities and supplies experience stigma and social exclusion while also forgoing important educational, social and economic opportunities.¹³⁸

Table WS.4.1 shows the percentage of women and girls aged 15-49 who menstruated in the last 12 months reporting having a private place to wash and change while at home. It also presents whether they used appropriate materials including reusable and non-reusable materials during last menstruation. Table WS.4.2 shows the percentage of women who reported not being able to participate in social activities, school or work during their last menstruation.

Equitable Chance In Life

 MICS
GENERATING EVIDENCE TO DELIVER FOR CHILDREN

11 Equitable Chance in Life

11.1

CHILD FUNCTIONING

The Convention on the Rights of Persons with Disabilities¹³⁹ outlines States Parties' obligations to ensure the full realization of rights for children with disabilities on an equal basis with other children. The presence of functional difficulties may place children at risk of experiencing limited participation in an unaccommodating environment, and limit the fulfilment of their rights.

Trinidad and Tobago 2022 MICS included child functioning modules intended to provide an estimate of the number/proportion of children with functional difficulties as reported by their mothers or primary caregivers. The module included in the Questionnaire for Children Under Five covered children between 2 and 4 years of age while a

similar module is also included in the Questionnaire for Children Age 5-17.

Functional domains covered in Questionnaire for Children Under Five are as follows: Seeing, hearing, walking, fine motor, communication, learning, playing, and controlling behaviour while functional domains covered in Questionnaire for Children Age 5-17 are as follows: Seeing, hearing, walking, self-care, communication, learning, remembering, concentrating, accepting change, controlling behaviour, making friends, anxiety, and depression. Tables EQ.1.1 and EQ.1.2 present the percentage of children by age group with functional difficulty by domain.

Table EQ.1.3 presents the percentage of children age 2-17 who use assistive devices and still have difficulty within the relevant functional domains.

Table EQ.1.4 is a summary table presenting the percentage of children by age group with functional difficulty.

139. "Convention on the Rights of Persons with Disabilities." United Nations. Accessed August 31, 2018. <https://www.un.org/development/desa/disabilities/convention-on-the-rights-of-persons-with-disabilities/convention-on-the-rights-of-persons-with-disabilities-2.html>.

11.2

SOCIAL TRANSFERS

Social protection is the set of public and private policies and programmes aimed at preventing, reducing and eliminating economic and social vulnerabilities to poverty and deprivation. Increasing volatility at the macro and household level, the persistence of inequalities and exclusion, threats posed to sustainable development by climate change and changing population trends have heightened the relevance and political momentum for social protection globally.¹⁴⁰

Social transfers or external economic support can be defined as ‘free economic help’ and includes various social protection schemes – examples in Trinidad and Tobago include monthly allowance assistances for elderly persons, underprivileged persons, disabled persons, food support, other types of cash grants (such as housing, clothing, education etc.), or any other types of ad-hoc support, excluding transfers or assistance from family members, relatives or neighbours.

Health insurance is one protection scheme and table EQ.2.1W presents the percentage of women age 15-49 years who have a health insurance and among those with an insurance, the percentage

insured by type of insurance. Tables EQ.2.2 and EQ.2.3 further elaborates the existence of health insurance for children under age five and 5-17 separately.

Table EQ.2.4 presents the percentage of households who are aware and have received external economic support, as reported by the respondent to the Household Questionnaire. The percentage of household members living in households that received social transfers or benefits in the last 3 months is further shown in Table EQ.2.5, by type of transfers and benefits. The benefits also include school tuition or school related other support available for any household member age 5-24. This table is an approximation to the SDG indicator 1.3.1 which is the proportion of population covered by social protection floors/systems.

It is well known that social and economic shocks affect the health conditions of individuals and undermine household resilience. These shocks affect the capacity of families to care for their children and place barriers to services that stand in the way of achieving goals and progress for children. In particular poor households are vulnerable to the

140. UNICEF. Collecting Data to Measure Social Protection Programme Coverage: Pilot-Testing the Social Protection Module in Viet Nam. A methodological report. New York: UNICEF, 2016. <http://mics.unicef.org/files?job=W1siZiIsIjltMTg0MDcvMTk0MjAvMzcvMzAvNzQ0LzRlZXRuYWVfUmVwb3J0X1BpbG90X1Rlc3RpbmdfU1BfTW9kdWwIX0RlY2VtYmVyXzlwMTZfRklOUUwUERGIlId&sha=3df47c3a17992c8f>

impacts of these shocks through the increased burden of health costs; the illness and death of household members, leading to labour constraints in the household and the further impoverishment of children who have lost one or both parents, or their primary caregiver; and other vulnerable children, cause them to drop out of school and engage in harmful child labour and other risky behaviours. As an attempt to measure coverage of social protection programmes, a global indicator, 'Proportion of the poorest households that received external economic support in the past three months', was proposed to measure the extent to which economic support is reaching households severely affected by various shocks.¹⁴¹ Table EQ.2.6 presents the percentage of households in the lowest two quintiles that received social transfers or benefits in the last 3 months, by type of transfers or benefits.

Finally, Table EQ.2.7 presents the percentage of children under age 18 living in households that received social transfers or benefits in the last 3 months, by type of transfers or benefits, while Table EQ.2.8 presents the percentage of children and young people age 5-24 years in all households who are currently attending school and received support for school tuition and other school related support during the current school year.

11.3

DISCRIMINATION AND HARASSMENT

Discrimination can impede individuals from accessing opportunities and services in a fair and equal manner. These questions are designed to measure the experiences of discrimination and harassment of respondents in the 12 months before the survey. The questions include specific grounds of discrimination and harassment which can increase the respondents' recall of events. The

current questions are based on a recommended set of questions available at the start of MICS6. The questions may change given that methodological development is currently underway to move the indicator from a Tier III SDG indicator classification to Tier II. Table EQ.3.1W shows the percentage of women who felt discriminated against based on a number of grounds.

Table EQ.3.1W: Discrimination and harassment (women)

Percentage of women age 15-49 years who in the past 12 months have felt discriminated against or harassed and those who have not felt discriminated against or harassed, Trinidad and Tobago, 2022

	Percentage of women who in the last 12 months have felt discriminated against or harassed on the basis of:									Percentage of women who have not felt discriminated against or harassed in the last 12 months	Number of women

SUBJECTIVE WELL-BEING

Subjective perceptions of individuals of their incomes, health, living environments and the like, play a significant role in their lives and can impact their perception of well-being, irrespective of objective conditions such as actual income and physical health status¹⁴².

Trinidad and Tobago 2022 MICS included a question about happiness and the respondents' overall satisfaction with life. To assist respondents in answering the question on happiness, they were shown a card with smiling faces (and not so smiling faces) that corresponded to the response categories (see the Questionnaires in Appendix E) 'very happy', 'somewhat happy', 'neither happy nor unhappy', 'somewhat unhappy' and 'very unhappy'. They were then shown a pictorial of a ladder with steps numbered from 0 at the bottom to 10 at the top and asked to indicate at which step of the ladder they feel they are standing at the time of the survey to indicate their level of life satisfaction. Table

EQ.4.1W presents the percentage of women age 15-49 years, who are very or somewhat satisfied with their life overall, ladder step reported and the average life satisfaction score.

In addition to the questions on life satisfaction and happiness, respondents were also asked two simple questions on whether they think their life improved during the last one year, and whether they think their life will be better in one year's time. Such information may contribute to the understanding of desperation that may exist among young people, as well as hopelessness and hopes for the future. Specific combinations of the perceptions during the last one year and expectations for the next one year may be valuable information to understand the general sense of well-being among young people. In Table EQ.4.2W, women's perceptions of a better life are shown.

Appendix A

Appendix A

SAMPLE DESIGN

The major features of the sample design are described in this appendix. Sample design features include defining the sampling frame, target sample size, sample allocation, listing in sample clusters, choice of domains, sampling stages, stratification, and the calculation of sample weights.

The primary objective of the sample design for the Trinidad and Tobago 2022 MICS was to produce statistically reliable estimates of most indicators, at the national level, for urban and rural areas, and for the five Regional Health Authorities (regions) of the country: North-West RHA, North-Central RHA, Eastern RHA, South-West RHA and Tobago RHA. Urban and rural areas in each of the five regions were defined as the sampling strata. In designing the sample for the Trinidad and Tobago 2022 MICS, it was useful to review the sample design and results of the MICS conducted in 2011, documented in the Final Report of that survey.

A multi-stage, stratified cluster sampling approach was used for the selection of the survey sample. The sampling frame was based on the 2011 Population and Housing Census. The primary sampling units

(PSUs) selected at the first stage were the enumeration districts (EDs) defined for the census enumeration. A listing of households was conducted in each sample ED, and a sample of households was selected at the second stage. This is a type of probability sample, in which each household and household member has a positive and known probability of selection, once the listing of households in the sample PSUs is complete, and the list of household members in each interviewed sample household is complete. With probability sampling, it is possible to make valid inferences to the population or any subgroup of the population, through weighting the data by the inverse of the overall probabilities of selection.

A.1 SAMPLE SIZE AND SAMPLE ALLOCATION

Since the overall sample size for the Trinidad and Tobago 2022 MICS partly depends on the geographic domains of analysis that are defined for the survey tables, the distribution of EDs and households in Trinidad and Tobago from the 2011 Population and Housing Census sampling frame was first examined by region, urban and rural strata, shown in Table SD.1.

Table SD.1: Distribution of Enumeration Districts and households in sampling frame

Distribution of EDs and households, by region, urban and rural strata, 2011 Population and Housing Census						
	Number of EDs			Number of Households (2011 P& H Census)		
	Total	Urban	Rural	Total	Urban	Rural
Total	2,802	1,711	1,091	401,383	240,914	160,469
Region						
North-West RHA	708	676	32	94,141	89,210	4,931
North-Central RHA	638	562	76	98,600	86,509	12,090
Eastern RHA	241	0	241	33,057	0	33,057
South-West RHA	1,067	430	637	155,460	58,933	96,527
Tobago RHA	148	43	105	20,125	6,262	13,864

The overall sample size for the Trinidad and Tobago 2022 MICS was determined as 7,200 households. Trinidad and Tobago has 15 municipalities, but it was not possible to have 15 domains of estimation with a sample size of 7,200. A minimum of 14,000 households would be necessary to consider 15 domains of estimation. Some of the Trinidad and Tobago MICS4 estimates at regional levels had very high coefficients of variation (cv) for some of the most important indicators. This means that in order

to improve the cv's of the important MICS indicators a higher sample size by domain of estimation is needed. Three variables (age-appropriate breastfeeding; marriage before 18; and women who have been tested for HIV and know their results) with values in the .10 to .30 range were used to determine a sample size. However, these variables produced sample sizes that are too big using the following formula:

$$n = \frac{[4(r)(1-r)(deff)]}{[(RME \times r)^2 (pb)(AveSize)(RR)]}$$

where:

<i>n</i>	=	the required sample size, expressed as number of households
<i>4</i>	=	a factor to achieve the 95 percent level of confidence
<i>r</i>	=	the predicted or anticipated value of the indicator, expressed in the form of a proportion
<i>deff</i>	=	the design effect for the indicator, estimated from a previous survey or using a default value of 1.5
<i>RME</i>	=	the relative margin of error of <i>r</i> to be tolerated at the 95 percent level of confidence; it is generally not more than 0.12 (12 percent) for national-level estimates
<i>pb</i>	=	the proportion of the total population upon which the indicator, <i>r</i> , is based
<i>AveSize</i>	=	the average household size (mean number of persons per household)
<i>RR</i>	=	the predicted response rate

Therefore, the total sample size at the national level was set at 7,200 households, in keeping with the 5 domains of estimation from MICS4, but with an increase in sample size of 1,200 households, aimed

at improving the coefficients of variation.

The allocation of the sample to the different domains of estimation is usually done to obtain a minimum

number of households in sample per domain to ensure a sufficient level of precision for the results for each domain. There are differential population sizes in the 5 domains of estimation and therefore the use of proportional allocation was not recommended. The cubic root allocation of the population/households proved to be better to obtain more reliable estimates for all domains.

The number of households selected per cluster for the Trinidad and Tobago 2022 MICS was determined

as 16 households, based on several considerations, including the design effect, the budget available, and the time that would be needed per team to complete one cluster. In each region, the clusters (primary sampling units) were distributed to the urban and rural strata proportionally to the number of households in the census frame for each stratum within that region. Table SD.2 shows the allocation of the clusters and households to the sampling strata.

Table SD.2: Sample allocation

Allocation of sample clusters (EDs) and sample households to sampling strata, Trinidad and Tobago 2022 MICS						
	Sample Clusters			Sample Households		
	Total	Urban	Rural	Total	Urban	Rural
Total	450	246	204	7,200	3,936	3,264
Region						
North-West RHA	100	90	10	1,600	1,440	160
North-Central RHA	102	90	12	1,632	1,440	192
Eastern RHA	70	0	70	1,120	0	1,120
South-West RHA	118	46	72	1,888	736	1,152
Tobago RHA	60	20	40	960	320	640

A.2

SELECTION OF ENUMERATION DISTRICTS (CLUSTERS)

Census enumeration districts were selected from each of the sampling strata by using systematic probability proportional to size (pps) sampling procedures, based on the number of households in each enumeration district from the 2011 Census frame. The first stage of sampling was thus completed by selecting the required number of sample EDs (specified in Table SD.2) from each of the five regions, separately for the urban and rural strata.

A.3

LISTING ACTIVITIES

Given that there had been many changes in the households enumerated in the 2011 Population and Housing Census, a new listing of households was conducted in all the sample enumeration districts prior to the selection of households. For this purpose, listing teams were trained to visit all the selected enumeration districts and list all households in each enumeration district.

Given that it is necessary to oversample households with children in the 0-4 age group, the listing form

identified households with and without children in the 0-4 age group in every ED that would be listed. The Trinidad and Tobago MICS listing form was modified from the standard MICS template to include building numbers, dwelling unit numbers, population etc. that would be useful for the updating of CSO's sampling frame for future surveys.

A total of 33 listers and 6 field supervisors were trained and recruited in February 2019. The listing team consisted of one (1) supervisor and five to six listers. The lister also served as the mapper under the guidance of the field supervisor. The original contracted period for this exercise was February 11th - May 30th 2019. However, even though many of the staff were experienced listers, a further extension was needed in the northern parts of Trinidad and in Tobago due to:

- High non response in areas where there are rental units
- Large spans of rural areas

Whilst 453 out of the 457 EDs (99%) were completed at the end of the May, two EDs remained outstanding due to the difficult terrain, one ED was overlooked and the other had an issue that needed resolution by the in-house Cartographers. The in-house staff of the Census and Surveys Unit of the CSO took the

responsibility to complete these latter 2 EDs. Eventually, all listing was completed by August 2019 by teams of experienced listers along with CSO staff.

Given the age of the 2011 Census frame, at the time of the listing, some EDs had undergone changes in the number of housing units established for an ED (ideally between 150 and 200). That being the case, there were five clusters that were in need of segmentation (splitting). There were also three clusters where the number of households listed did not exceed the sample size of 16 households. These were all due to significant changes to the landscape of the EDs since the 2011 Population and Housing Census.

A.4 SELECTION OF HOUSEHOLDS

Lists of households were prepared by the listing teams in the field for each enumeration district. The households listed within each ED were then sequentially numbered, separately for the households with and without children under 5 years, at the Central Statistical Office, where the selection of households in each group within the enumeration district was carried out using random systematic selection procedures. The MICS6 spreadsheet

template for systematic random selection of households was adapted for this purpose.¹⁴⁵ However, due to the COVID19 pandemic, the planned conduct of the MICS fieldwork moved from April 2020 to August 2022. Given that there would be changes in the listing from 2019, a comparative exercise was done and it was decided to increase the sample size by 25% to cater for this. Therefore the sample size per cluster would move from 16 to 20 households in each ED. A new sample of 9,000 households was drawn, increasing the overall sample size from the previous 7,200 households.

The households listed in each sample cluster were divided into two strata for the second stage selection: households with children under age 5 and households without children under age 5. A separate sample of households was selected from each group, using a higher sampling rate for households with children under 5. This sampling strategy increased the number of children under 5 in the sample to increase the precision of the indicators based on under-5 children.

Of the 20 households selected in each cluster, the target number of sample households with children under age 5 years was 10. Therefore, in sample clusters where more than 10 households with children under age 5 were listed, 10 of these households were selected using random systematic

145. Available here: "MICS6 TOOLS" Home - UNICEF MICS. Accessed August 31, 2018. <http://mics.unicef.org/tools#survey-design>.

sampling; and 10 households without children under age 5 were selected from the other stratum. In sample clusters where 10 or less households with children under 5 were listed, all of these households were selected for the survey. In these clusters, the number of households without children under 5 to be selected was equal to 20 minus the number of households with children.

The Trinidad and Tobago 2022 MICS also included water quality testing for a subsample of households within each sample cluster. A subsample of 5 of the 20 selected households was selected in each sample cluster using random systematic sampling for conducting water quality testing, for both water in the household and at the source. The MICS household selection template includes an option to specify the number of households to be selected for the water quality testing, and the spreadsheet automatically selected the corresponding subsample of households.¹⁴⁵

A standard quality control measure was implemented through blank testing (a test of uncontaminated water) to assess whether teams were correctly performing the water testing procedure. One blank test was assigned to each cluster, but for practical purposes relating to data capture, this was assigned to the first household number selected for water quality testing.

A.5

CALCULATION OF SAMPLE WEIGHTS

The Trinidad and Tobago 2022 MICS sample is not self-weighting. Essentially, a different sampling rate was used for each region, and the probabilities within each sample ED were different for the households with and without children under the age of 5 years. For this reason, sample weights were calculated and used in the subsequent analyses of the survey data.

The major component of the weight is the reciprocal of the sampling fraction employed in selecting the number of sample households in that particular sampling stratum (h) and PSU (i):

$$W_{hi} = \frac{1}{f_{hi}}$$

The term f_{hi} , the sampling probability for the i -th sample PSU in the h -th stratum, is the product of the probabilities of selection at every stage in each sampling stratum:

$$f_{hi} = p_{1hi} \times p_{2hi} \times p_{3hi}$$

where p_{shi} is the probability of selection of the

sampling unit at stage s for the i -th sample PSU in the h -th sampling stratum. Based on the sample design, these probabilities were calculated as follows:

$$p_{1hi} = \frac{n_h \times M_{hi}}{M_h}$$

n_h = number of sample PSUs selected in stratum h

M_{hi} = number of households in the 2011 Census frame for the i -th sample PSU in stratum h

M_h = total number of households in the 2011 Census frame for stratum h

p_{2hi} = proportion of the PSU listed in the i -th sample PSU in stratum h (in the case of PSUs that were segmented); for non-segmented PSUs, $p_{2hi} = 1$

Within each sample ED the last stage probability p_{3hi} will vary for the households with and without children under 5 years, given that a separate sample was selected for each group. For this reason, separate weights were calculated for each group of households in the sample ED.

Based on the stratified two-stage sample design, the probability of selection for the sample households with children under 5 within a sample ED was calculated as follows:

$$f_{hi(wc)} = \frac{n_h \times M_{hi}}{M_h} \times p_{2hi} \times \frac{m_{hi(wc)}}{M'_{hi(wc)}}$$

where:

$f_{hi(wc)}$ = probability of selection for the sample households with children under 5 in the i -th sample PSU in stratum h

n_h, M_{hi}, M_h and p_{2hi} are identical to the earlier definition

$m_{hi(wc)}$ = number of sample households with children under 5 selected in the i -th sample PSU in stratum h

$M'_{hi(wc)}$ = total number of households with children under 5 listed in the i -th sample PSU in stratum h

The corresponding overall probability of selection for the households without children was calculated as follows:

$$f_{hi(woc)} = \frac{n_h \times M_{hi}}{M_h} \times p_{2hi} \times \frac{m_{hi(woc)}}{M'_{hi(woc)}}$$

where:

$f_{hi(woc)}$ = probability of selection for the sample households without children under 5 in the i -th sample PSU in stratum h

$M_{hi(woc)}$ = number of sample households without children under 5 selected in the i -th sample PSU in stratum h

$M'_{hi(woc)}$ = total number of households without children under 5 listed in the i -th sample PSU in stratum h .

Individual overall probabilities of selection for households were calculated for the groups of households with and without children under 5 years in each sample ED (cluster).

A final component in the calculation of sample weights takes into account the level of non-response for the household and individual interviews by stratum, as well as the sample cluster completion rate for each stratum. The adjustment for the cluster and household non-response in each stratum is equal to:

$$\frac{n_h}{n'_h} \times \frac{1}{RR_h}$$

where RR_h is the response rate for the sample households in stratum h , defined as the proportion

of the number of interviewed households in stratum h out of the number of selected households found to be occupied during the fieldwork in stratum h . The term n'_h is the number of sample clusters with complete enumeration in stratum h , so the first adjustment factor corresponds to the inverse of the sample cluster completion rate for stratum h . This additional adjustment factor is needed in the case where some sample clusters cannot be enumerated in some strata due to security or accessibility problems. In the case where all the sample clusters in each stratum are enumerated, this cluster adjustment factor is equal to 1 for all strata, so it does not affect the weight. This adjustment of the household weight based on the cluster completion rate is included in the corresponding formulas in the MICS template for calculating the weights.

Similarly, adjustment for non-response at the individual level (women and under-5 children) for each stratum is equal to:

$$\frac{1}{RR_{qh}}$$

where RR_{qh} is the response rate for the individual questionnaires in stratum h , defined as the proportion of eligible individuals (women and under-5 children) in the sample households in stratum h who were successfully interviewed.

After the completion of fieldwork, response rates

were calculated for each sampling stratum. These were used to adjust the sample weights calculated for each cluster. Response rates in the Trinidad and Tobago 2022 MICS are shown in Table SR.1.1 in this report.

The non-response adjustment factors for the individual women and under-5 questionnaires were applied to the adjusted household weights. Numbers of eligible women and under-5 children were obtained from the list of household members in the Household Questionnaire for households where interviews were completed.

In the case of the questionnaire for children age 5-17 years, in each sample household, one child was randomly selected from all the children in this age group recorded in the list of household members, in effect a tertiary sampling unit. The household weight for the children age 5-17 years is first adjusted based on the response rate for this questionnaire at the stratum level. Once this adjusted household weight is normalised as described below, it is multiplied by the number of children age 5-17 years recorded in the list of household members. Therefore, the weights for the individual children age 5-17 years will vary by sample household. This weighting of the data for the children age 5-17 years old is implemented in the tabulation programs for the corresponding tables.

For the water quality testing (both in household and at source) a subsample of 5 households was selected from the 20 MICS sample households in each sample cluster. Therefore, the basic (unadjusted) household weight would be multiplied by the inverse of this subsampling rate as follows:

$$W_{wqhi} = \frac{1}{f_{hi}} \times \frac{20}{5} = \frac{4}{f_{hi}}$$

where:

W_{wqhi} = basic weight for the subsample of households selected for the water quality testing in the i -th sample ED in stratum h

Since the response rate may be different for the water quality testing for home consumption and at the source, the basic weights for each were adjusted separately for non-response at the stratum level as follows:

$$W'_{wqhi} = W_{wqhi} \times \frac{n_h}{n'_h} \times \frac{m_{wqh}}{m'_{wqh}}$$

where:

W'_{wqhi} = adjusted weight for the subsample of households selected for the water quality testing in the i -th sample ED in stratum h (separately for water quality testing in the

household and at the source

m_{wqh} = number of valid (occupied) sample households selected for water quality testing in stratum h

m'_{wqh} = number of sample households with completed water quality testing in stratum h (separately for water quality testing in the household and at the source)

As in the case of the adjustment of the raw household weights, an adjustment factor equal to the inverse of the cluster completion rate (n_h/n'_h) for the stratum is necessary to account for any sample clusters that could not be enumerated within a stratum. As mentioned above, this factor is equal to 1 for any stratum for which all the sample clusters were enumerated.

The Trinidad and Tobago 2022 MICS full (raw) weights for the households were calculated by multiplying the inverse of the probabilities of selection by the non-response adjustment factor for each stratum. These weights were then standardised (or normalised), one purpose of which is to make the weighted sum of the interviewed sample units equal to the total sample size at the national level. Normalisation is achieved by dividing the full sample

weights (adjusted for nonresponse) by the average of these weights across all households at the national level. This is performed by multiplying the sample weights by a constant factor equal to the unweighted number of households at the national level divided by the weighted total number of households (using the full sample weights adjusted for non-response). A similar standardisation procedure was followed in obtaining standardised weights for the individual women, under-5 questionnaires and water quality testing. Adjusted (normalised) household weights varied between 0.0115 and 17.571 in the 450 sample enumeration districts (clusters).

Sample weights were appended to all data sets and analyses were performed by weighting the data for households, women, under-5s, 5-17-year olds and water quality testing with these sample weights.

ESTIMATES OF SAMPLING ERRORS

The sample of respondents selected in the Trinidad and Tobago 2022 Multiple Indicator Cluster Survey is only one of the samples that could have been selected from the same population, using the same design and size. Each of these samples would yield results that differ somewhat from the results based on the actual sample selected. Sampling errors are a measure of the variability between the estimates from all possible samples. The extent of variability is not known exactly, but can be estimated statistically from the survey data.

The following sampling error measures are presented in this appendix for each of the selected indicators:

- Standard error (se): Standard error is the square root of the variance of the estimate. For survey indicators that are means, proportions or ratios, the Taylor series linearization method is used for the estimation of standard errors. For more complex statistics, such as fertility and mortality rates, the Jackknife repeated replication method is used for standard error estimation.
- Coefficient of variation (se/r) is the ratio of the standard error to the value (r) of the indicator, and is a measure of the relative sampling error.
- Design effect (deff) is the ratio of the actual variance of an indicator, under the sampling method used in the survey, to the variance calculated under the assumption of simple random sampling based on the same sample size. The square root of the design effect (deft) is used to show the efficiency of the sample design in relation to the precision. A deft value of 1.0 indicates that the sample design of the survey is as efficient as a simple random sample for a particular indicator, while a deft value above 1.0 indicates an increase in the standard error due to the use of a complex sample design. If a deft (or deff) value is less than 1.0 and the corresponding number of observations is relatively small, the values of the standard error and confidence limits should be used with caution. These situations might stem from the small number of observations and the distribution of the indicator values within and between the sample clusters in such estimation domains.
- Confidence limits are calculated to show the interval which contains the true value of the indicator for the population, with a specified level of confidence. For MICS results 95% confidence intervals are used, which is the standard for this type of survey. The concept of

the 95% confidence interval can be understood in this way: if many repeated samples of identical size and design were taken and the confidence interval computed for each sample, then 95% of these intervals would contain the true value of the indicator.

For the calculation of sampling errors from MICS data, programs developed in CSPro Version 6.3 and SPSS Version 24 Complex Samples module have been used.

The results are shown in the tables that follow. Sampling errors are calculated for SDG indicators for which SEs can be calculated, and several other MICS indicators. Definitions, numerators and denominators of each of these indicators are provided in Chapter 3. Results are presented for the national level (Table SE.1), for urban and rural areas (Tables SE.2 and SE.3), and for all regions (Tables SE.4 to SE.8).

In addition to the sampling error measures described above, the tables also include weighted and unweighted counts of denominators for each indicator. Given the use of normalized weights, by comparing the weighted and unweighted counts it is possible to determine whether a particular domain has been under-sampled or over-sampled compared to the average sampling rate. If the weighted count is smaller than the unweighted

count, this means that the domain had been over-sampled.

For the following indicators, however, the unweighted count represents the number of sample households, and the weighted counts reflect the weighted total population living in these households.

- Access to electricity
- Primary reliance on clean fuels and technologies for cooking, space heating and lighting
- Use of basic drinking water services
- Use of safely managed drinking water services
- Handwashing facility with water and soap
- Use of basic sanitation services
- Safe disposal in situ of excreta from on-site sanitation facilities
- Population covered by social transfers

44	153	1.4	137	1.2	Total	10,852	100.0	10,983	100.0

^AAs this table includes all household members listed in interviewed households, the numbers and distributions by sex do not match those shown for individuals in Tables SR.5.1W/M, SR.5.2 and SR.5.3 where interviewed individuals are weighted with individual sample weights. Tables DQ.1.2W/M, DQ.1.3 and DQ.1.4 similarly use household sample weights and do not match distributions obtained through individual questionnaires.

Table DQ.1.2W: Age distribution of eligible and interviewed women

Household population of women age 10-54 years, interviewed women age 15-49 years, and percentage of eligible women who were interviewed, Trinidad and Tobago, 2022

	Household population of women age 10-54 years	Interviewed women age 15-49 years		Percentage of eligible women interviewed (Completion rate)
	Number	Number	Percent

D.3**COMPLETENESS AND MEASUREMENTS**

Table DQ.3.2: Completeness and quality of information of water quality testing									
Percentage of households selected for and with complete water quality testing at household and source, and (unweighted) percentage of positive blank tests, Trinidad and Tobago, 2022									
	Percentage of households:			Percentage of households with complete water quality test for:			Blank tests (unweighted)		
	Selected for Water Quality Testing questionnaire	With completed Water Quality Testing questionnaire	Number of households	Household drinking water	Source of drinking water	Number of households selected for Water Quality Testing Questionnaire	Percentage positive	Number completed	Number of households selected ^A
Total	24.9	24.4	7,499	97.7	84.0	1,869	0.5	350	383
Area									
Urban	24.7	24.1	4,482	97.5	78.3	1,109	0.5	186	208
Rural	25.2	24.7	3,017	98.1	92.3	760	0.6	164	175

^AOne blank test (a test of uncontaminated water) was performed in each cluster. For practical reasons, the blank test was assigned to the first of the households selected for water quality testing.

Table DQ.3.3W: Completeness of information on dates of marriage/union and sexual intercourse (women)

Percentage of women age 15-49 years with missing or incomplete information on date of and age at first marriage/union and age at first intercourse and time since last intercourse, Trinidad and Tobago, 2022

	Percent with missing/ incomplete information ^A	Number of women
Ever married (age 15-49 years)		
Date of first marriage/union missing	30.3	3,017
Only month missing	13.4	3,017
Both month and year missing	15.7	3,017
Age at first marriage/union missing	2.4	3,017
Ever had sex (age 15-49 years)		
Age at first intercourse missing	5.7	4,584
Time since last intercourse missing	9.1	4,584
Ever had sex (age 15-24 years)		
Age at first intercourse missing	11.3	678
Time since last intercourse missing	12.4	678

^AIncludes "Don't know" responses

Table DQ.3.8: Completeness of information for foundational learning skills indicators

Percent distribution of selected children age 7-14 years by completion of the foundational learning skills (FL) module, percentage for whom the reading book was unavailable in appropriate language and those with insufficient number recognition skills for testing, and percentage children age 7-9 years who did not complete the reading and comprehension practise, Trinidad and Tobago, 2022

	Percent distribution of children with:					Total	Number of selected children age 7-14 years	Percentage of children:				
	Completed foundational learning skills (FL) module	Incomplete FL modules, by reason:						For whom the reading book was not available in appropriate language	With insufficient number recognition skill for testing	Number of children age 7-14 years with completed FL module	Percentage of children who did not complete reading and comprehension practise	Number of children age 7-9 years with completed FL module

TRINIDAD AND TOBAGO 2022 MICS QUESTIONNAIRES

The questionnaires of the Trinidad and Tobago 2022 MICS are presented in English

- Household Questionnaire
- Water Quality Testing Questionnaire
- Questionnaire for Individual Women
- Questionnaire for Children Under Five
- Questionnaire for Children Age 5-17

Response cards and questionnaire aids:

- Sentences for literacy testing in English
- Response card for Life Satisfaction module
- Reading & Numbers Book for Foundational Learning Skills module in English

HOUSEHOLD QUESTIONNAIRE
Trinidad and Tobago 2022 MICS

HOUSEHOLD INFORMATION PANEL				HH
HH1. Cluster number: _____		HH2. Household number: _____		
HH3. Interviewer's name and number: NAME _____		HH4. Supervisor's name and number: NAME _____		
HH5. Day / Month / Year of interview: ____ / ____ / <u>2 0 2 2</u>		HH7. Region: NORTH-WEST RHA 1 NORTH-CENTRAL RHA 2 EASTERN RHA 3 SOUTH-WEST RHA 4 TOBAGO RHA 5		
HH6. Area:	URBAN 1 RURAL 2			
HH9. Is the household selected for WATER QUALITY TESTING?	YES 1 NO 2	HH10. Is the household selected for blank testing?	YES 1 NO 2	
Check that the respondent is a knowledgeable member of the household and at least 18 years old before proceeding. You may only interview a child age 15-17 if there is no adult member of the household or all adult members are incapacitated. You may not interview a child under age 15.				HH11. Record the time. HOURS : MINUTES ____ : ____
HH12. Hello, my name is (<i>your name</i>). We are from Central Statistical Office. We are conducting a survey about the situation of children, families and households. I would like to talk to you about these subjects. This interview usually takes about 30 minutes. Following this, I may ask to conduct additional interviews with you or other individual members of your household. All the information we obtain will remain strictly confidential and anonymous. If you do not wish to answer a question or if you wish to stop the interview, please let me know. May I start now?				
YES..... 1		1 ⇒LIST OF HOUSEHOLD MEMBERS		
NO / NOT ASKED 2		2 ⇒HH46		
HH46. Result of Household Questionnaire interview: Discuss any result not completed with Supervisor.	COMPLETED 01 NO HOUSEHOLD MEMBER AT HOME OR NO COMPETENT RESPONDENT AT HOME AT TIME OF VISIT 02 ENTIRE HOUSEHOLD ABSENT FOR EXTENDED PERIOD OF TIME 03 REFUSED 04 DWELLING VACANT OR ADDRESS NOT A DWELLING 05 DWELLING DESTROYED 06 DWELLING NOT FOUND 07 OTHER (<i>specify</i>) 96			
HH47. Name and line number of the respondent to Household Questionnaire interview: NAME _____	<i>To be filled after the Household Questionnaire is completed</i>		<i>To be filled after all the questionnaires are completed</i>	
HOUSEHOLD MEMBERS	TOTAL NUMBER		COMPLETED NUMBER	
WOMEN AGE 15-49	HH48	_____	HH53	_____
CHILDREN UNDER AGE 5	HH49	_____	HH55	_____
CHILDREN AGE 5-17	HH51	_____	HH56	ZERO 0 ONE 1
	HH52	_____		

LIST OF HOUSEHOLD MEMBERS

HL

First complete HL2-HL4 vertically for all household members, starting with the head of the household. Once HL2-HL4 are complete for all members, make sure to probe for additional members: Those that are not currently at home, any infants or small children and any others who may not be family (such as servants, friends) but who usually live in the household.
 Then, ask questions HL5-HL20 for each member one at a time. If additional questionnaires are used, indicate by ticking this box:

HL1. Line number	HL2. First, please tell me the name of each person who usually lives here, starting with the head of the household. Probe for additional household members.	HL3. What is the relationship of (name) to (name of the head of household)?	HL4. Is (name) male or female? 1 MALE 2 FEMALE	HL5. What is (name)'s date of birth?	HL6. How old is (name)? Record in completed years. If age is 95 or above, record '95'.	HL6A. In what country was (name) born?	HL6B. What is (name)'s country of citizenship?	HL7A. What is (name)'s religion?	HL7B. To which ethnic group does (name) belong?	HL8. Record line number if woman and age 15-49.	HL10. Record line number if age 0-4.	HL11. Age 0-17? 1 YES 2 NO	HL12. Is (name)'s natural mother alive?	HL13. Does (name)'s natural mother live in this household?	HL14. Record the line number of mother and go to HL16.	HL15. Where does (name)'s natural mother live?	HL16. Is (name)'s natural father alive?	HL17. Does (name)'s natural father live in this household?	HL18. Record the line number of father and go to HL20.	HL19. Where does (name)'s natural father live?	HL20. Copy the line number of mother from HL14. If blank, ask: Who is the primary caretaker of (name)? If 'No one' for a child age 15-17, record '90'.

HH25. Check the last digit of the household number (HH2) from the HOUSEHOLD INFORMATION PANEL. This is the number of the row you should go to in the table below.

Check the total number of children age 5-17 years in HH18 above. This is the number of the column you should go to in the table below.

Find the box where the row and the column meet and record the number that appears in the box. This is the rank number (HH20) of the selected child.

LAST DIGIT OF HOUSEHOLD NUMBER (FROM HH2)	TOTAL NUMBER OF ELIGIBLE CHILDREN IN THE HOUSEHOLD (FROM HH18)						
	2	3	4	5	6	7	8+
0	2	2	4	3	6	5	4
1	1	3	1	4	1	6	5
2	2	1	2	5	2	7	6
3	1	2	3	1	3	1	7
4	2	3	4	2	4	2	8
5	1	1	1	3	5	3	1
6	2	2	2	4	6	4	2
7	1	3	3	5	1	5	3
8	2	1	4	1	2	6	4
9	1	2	1	2	3	7	5

HH26. Record the rank number (HH20), line number (HH21), name (HH22) and age (HH24) of the selected child.

RANK NUMBER

HH27. (When HH18=1 or when there is a single child age 5-17 in the household): Record the rank number as '1' and record the line number (HL1), the name (HL2) and age (HL6) of this child from the LIST OF HOUSEHOLD MEMBERS.

LINE NUMBER

NAME

AGE

HH28. Issue a QUESTIONNAIRE FOR CHILDREN AGE 5-17 to be administered to the mother/caretaker of this child.

HH29. Check HL8 in the LIST OF HOUSEHOLD MEMBERS: Are there any women age 15-49?

YES, AT LEAST ONE WOMAN AGE 15-49
..... 1
NO 2

2 ⇒ HH40

HH30. Issue a separate QUESTIONNAIRE FOR INDIVIDUAL WOMEN for each woman age 15-49 years.

HH31. Check HL6 and HL8 in the LIST OF HOUSEHOLD MEMBERS: Are there any girls age 15-17?

YES, AT LEAST ONE GIRL AGE 15-17... 1
NO 2

2 ⇒ HH40

<p>HH32. Check HL20 in the LIST OF HOUSEHOLD MEMBERS: Is consent required for interviewing at least one girl age 15-17?</p>	<p>YES, AT LEAST ONE GIRL AGE 15-17 WITH HL20≠90 1 NO, HL20=90 FOR ALL GIRLS AGE 15-17 2</p>	<p>2 ⇒ HH40</p>
<p>HH33. As part of the survey we are also interviewing women age 15-49. We ask each person we interview for permission. A female interviewer conducts these interviews.</p> <p>For girls age 15-17 we must also get permission from a parent (or an adult if no parent is in the household) to interview them. As mentioned before, all the information we obtain will remain strictly confidential and anonymous.</p> <p><i>If the household questionnaire respondent is not a parent of (name(s) of female member(s) age 15-17) make necessary arrangements to get her/their parent's consent.</i></p> <p>May we interview (name(s) of female member(s) age 15-17) later?</p> <p><input type="checkbox"/> 'Yes' for all girls age 15-17 ⇒ Continue with HH40.</p> <p><input type="checkbox"/> 'No' for at least one girl age 15-17 and 'Yes' to at least one girl age 15-17 ⇒ Record '06' in WM17 (also in UF17 and FS17, if applicable) on individual questionnaires for those parental/adult consent was not given. Then continue with HH40.</p> <p><input type="checkbox"/> 'No' for all girls age 15-17 ⇒ Record '06' in WM17 (also in UF17 and FS17, if applicable) on all individual questionnaires for whom parental/adult consent was not given. Then continue with HH40.</p>		
<p>HH40. Check HL10 in the LIST OF HOUSEHOLD MEMBERS: Are there any children age 0-4?</p>	<p>YES, AT LEAST ONE 1 NO 2</p>	<p>2 ⇒ HH42</p>
<p>HH41. Issue a separate QUESTIONNAIRE FOR CHILDREN UNDER FIVE for each child age 0-4 years.</p>		
<p>HH42. Check HH9 in the HOUSEHOLD INFORMATION PANEL: Is the household selected for WATER QUALITY TESTING QUESTIONNAIRE?</p>	<p>YES, HH9=1 1 NO, HH9=2 2</p>	<p>2 ⇒ HH44A</p>
<p>HH43. Issue a separate WATER QUALITY TESTING QUESTIONNAIRE for this household</p>		
<p>HH44. As part of the survey we are also looking at the quality of drinking water. We would like to do a simple test of your drinking water. A colleague will come and collect the water samples. May we do such a test?</p> <p><i>If the respondent requests to learn the results, explain that results will not be shared with individual households but will be made available to local authorities.</i></p>	<p>YES, PERMISSION IS GIVEN 1 NO, PERMISSION IS NOT GIVEN 2</p>	<p>2 ⇒ Record '02' in WQ31 on the WATER QUALITY TESTING QUESTIONNAIRE</p>

MICS PLUS CONSENT		
HH44A. Check HC7[A] and HC12: Does this household have a fixed telephone line or does any member of the household own a mobile phone?	YES, HC7[A]=1 OR HC12=1 1 NO, HC7[A]=2 AND HC12=2 2	2 ⇒ HH45
<p>HH44B. Thank you for your participation.</p> <p>The Central Statistical Office will be conducting a phone survey about the situation of children, families and households in the future. We would like to invite you to participate in this survey. If you agree to participate, we will ask you to share a phone number we can reach you at and convenient times to contact you. The phone interview will take about 15 minutes, and we may call you a few times over a period of a few months. Participation in this phone survey is voluntary, and even if you agree to participate now, you may decide to withdraw from participation in the future. There will be no costs to you for participating in the phone survey. Please know that all the information you share during future phone interviews will remain strictly confidential, and your phone number will not be shared with anyone outside our team. Would you like to participate?</p>		
YES 1 NO 2		2 ⇒ HH45
HH44C. Do you have a personal phone number or does your household have a communal number where you can be reached?	YES 1 NO 2	2 ⇒ HH45
<p>HH44D. You may share your household communal number, but please, do not share any personal phone numbers that belong to individual members of your household. Please, tell me what is the best phone number to contact you on.</p>		

	[P1] BEST NUMBER	[P2] 2 ND NUMBER	[P3] 3 RD NUMBER
HH44E. Ask for and record phone number.	_____	_____	_____
HH44F. Just to confirm, the number is (<i>number from HH44E</i>)? <i>If no, return to HH44E and correct entry.</i>	YES 1 NO 2 ☞ <i>HH44E</i>	YES 1 NO 2 ☞ <i>HH44E</i>	YES 1 NO 2 ☞ <i>HH44E</i>
HH44G. Is this a fixed line or a mobile phone number?	FIXED LINE 1 MOBILE 2	FIXED LINE 1 MOBILE 2	FIXED LINE 1 MOBILE 2
HH44H. What is the best day of the week and time of the day to call you on this number? <i>Probe: Any other day or time?</i> <i>Record all mentioned.</i>	WEEKDAYS MORNING A AFTERNOON B EVENING C OTHER (specify) D WEEKEND MORNING E AFTERNOON F EVENING G OTHER (specify) H OTHER (specify) X	WEEKDAYS MORNING A AFTERNOON B EVENING C OTHER (specify) D WEEKEND MORNING E AFTERNOON F EVENING G OTHER (specify) H OTHER (specify) X	WEEKDAYS MORNING A AFTERNOON B EVENING C OTHER (specify) D WEEKEND MORNING E AFTERNOON F EVENING G OTHER (specify) H OTHER (specify) X
HH44I. Remember, you may share your household communal number, but please, do not share any personal phone numbers that belong to individual members of your household. Do you have another personal or communal phone number where you can be reached?	YES 1 ☞ <i>[P2]</i> NO 2 ☞ <i>HH45</i>	YES 1 ☞ <i>[P3]</i> NO 2 ☞ <i>HH45</i>	YES 1 ☞ <i>[P4]</i> NO 2 ☞ <i>HH45</i>

Tick here if additional questionnaire used:

HH45. Now return to the *HOUSEHOLD INFORMATION PANEL* and,

- Record '01' in question HH46 (Result of the *HOUSEHOLD QUESTIONNAIRE* interview),
- Record the name and the line number (from the *LIST OF HOUSEHOLD MEMBERS*) of the Respondent to the *HOUSEHOLD QUESTIONNAIRE* interview in HH47,
- Fill the questions HH48 – HH52,
- Thank the respondent for his/her cooperation and then
- Proceed with the administration of the remaining individual questionnaire(s) in this household.

If there is no individual questionnaire and no WATER QUALITY TESTING QUESTIONNAIRE to be completed in this household thank the respondent for his/her cooperation and move to the next household you have been assigned by your supervisor.

MICS PLUS CONSENT

WM15A. Check the respondent's line number (WM3) in WOMAN'S INFORMATION PANEL and the respondents to the HOUSEHOLD QUESTIONNAIRE (HH47) or 5 to 17 QUESTIONNAIRE (FS4) or UNDER FIVE QUESTIONNAIRE (UF4): Has this respondent been already interviewed for any of the other questionnaires?

YES, RESPONDENT IS THE SAME,
WM3=HH47 OR WM3=FS4 OR WM3=UF4.....1

NO, RESPONDENT IS NOT THE SAME, WM3≠HH47
AND WM3≠FS4 AND WM3≠UF4.....2

1 ⇒ WM16

WM15B. Check HC7[A] and HC12: Does this household have a fixed telephone line or does any member of the household own a mobile phone?

YES, HC7[A]=1 OR HC12=1.....1

NO, HC7[A]=2 AND HC12=2.....2

2 ⇒ WM16

WM15C. Thank you for your participation.

The Central Statistical Office will be conducting a phone survey about the situation of children, families and households in the future. We would like to invite you to participate in this survey. If you agree to participate, we will ask you to share a phone number we can reach you at and convenient times to contact you. The phone interview will take about 15 minutes, and we may call you a few times over a period of a few months. Participation in this phone survey is voluntary, and even if you agree to participate now, you may decide to withdraw from participation in the future. There will be no costs to you for participating in the phone survey. Please know that all the information you share during future phone interviews will remain strictly confidential, and your phone number will not be shared with anyone outside our team. Would you like to participate?

YES 1

NO 2

2 ⇒ WM16

WM15D. Do you have a personal phone number or does your household have a communal number where you can be reached?

YES 1

NO 2

2 ⇒ WM16

WM15E. You may share your household communal number, but please, do not share any personal phone numbers that belong to individual members of your household. Please, tell me what is the best phone number to contact you on.

	[P1] BEST NUMBER	[P2] 2 ND NUMBER	[P3] 3 RD NUMBER
WM15F. Ask for and record phone number.	_____	_____	_____

<p>FL18A. <i>Turn the page to reveal the reading passage. Say:</i> Thank you. Now I want you to try this.</p>								<p>⇒FL19</p>
<p>FL18B. <i>Give the child the READING & NUMBERS BOOK.</i> <i>Open the book on the page of the reading passage.</i></p>								
<p>FL19. Here is a story. I want you to read it aloud as carefully as you can. You will start here (<i>point to the first word on the first line</i>) and you will read line by line (<i>point to the direction for reading each line</i>). When you finish, I will ask you some questions about what you have read. If you come to a word you do not know, go on to the next word. Put your finger on the first word. Ready? Begin.</p>	Harry	is	in	standard	two.	One	day,	
	1	2	3	4	5	6	7	
	Harry	was	going	home	from	school.	He	
	8	9	10	11	12	13	14	
	saw	some	red	flowers	on	the	way.	
	15	16	17	18	19	20	21	
	The	flowers	were	near	a	tomato	garden.	
	22	23	24	25	26	27	28	
	Harry	wanted	to	get	some	flowers	for	
	29	30	31	32	33	34	35	
	his	mother.	Harry	ran	fast	across	the	
	36	37	38	39	40	41	42	
	garden	to	get	the	flowers.	He	fell	
	43	44	45	46	47	48	49	
	down	near	a	banana	tree.	Harry	started	
	50	51	52	53	54	55	56	
	crying.	The	farmer	saw	him	and	came.	
57	58	59	60	61	62	63		
He	gave	Harry	many	flowers.	Harry	was		
64	65	66	67	68	69	70		
very	happy.							
71	72							

<p>FL20. <i>Results of the child's reading.</i></p> <p><i>Incorrect or missed words (B) are those marked incorrect while reading plus the difference between the number of the last word in the story (72) and the last word attempted (A).</i></p> <p><i>If the child did not try to read the story, record '00' as the last word attempted (A).</i></p>	<p>LAST WORD ATTEMPTED (A)..... NUMBER __ __</p> <p>TOTAL NUMBER OF WORDS INCORRECT OR MISSED (B)..... NUMBER __ __</p>	
<p>FL21A. <i>Check FL20(B): Did the child incorrectly read or miss 8 or more words?</i></p>	<p>YES, AT LEAST 8 INCORRECT WORDS 1</p> <p>NO, LESS THAN 8 INCORRECT WORDS..... 2</p>	<p>1 ⇨ FL23</p>

<p>FL21B. Now I am going to ask you a few questions about what you have read.</p> <p><i>If the child does not provide a response after a few seconds, repeat the question. If the child seems unable to provide an answer after repeating the question, mark ‘No response’ and say: Thank you. That is ok. We will move on.</i></p> <p><i>Make sure the child can still see the passage and ask:</i></p> <p>[A] What standard is Harry in?</p> <p>[B] What did Harry see on the way home?</p> <p>[C] Why did Harry start crying?</p>	<p>CORRECT TWO 1 INCORRECT..... 2 NO RESPONSE / SAYS ‘I DON’T KNOW’ 3</p> <p>CORRECT FLOWERS 1 INCORRECT..... 2 NO RESPONSE / SAYS ‘I DON’T KNOW’ 3</p> <p>CORRECT BECAUSE HE FELL 1 INCORRECT..... 2 NO RESPONSE / SAYS ‘I DON’T KNOW’ 3</p>	
<p>[D] <i>Check FL21B[A-C]: Did the child answer all three questions correctly?</i></p>	<p>YES, ALL CORRECT, FL21B[A-C]=1 1 NO, AT LEAST ONE INCORRECT OR WITH NO RESPONSE/DK 2</p>	<p>2 ⇒ FL23</p>
<p>[E] Where did Harry fall (down)?</p> <p>[F] Why was Harry happy?</p>	<p>CORRECT NEAR A BANANA TREE 1 INCORRECT..... 2 NO RESPONSE / SAYS ‘I DON’T KNOW’ 3</p> <p>CORRECT BECAUSE THE FARMER GAVE HIM MANY FLOWERS OR BECAUSE HE HAD FLOWERS TO GIVE TO HIS MOTHER 1 INCORRECT..... 2 NO RESPONSE / SAYS ‘I DON’T KNOW’ 3</p>	

<p>FL23. Turn the page in the <i>READING & NUMBERS BOOK</i> so the child is looking at the list of numbers. Make sure the child is looking at this page.</p> <p>Now here are some numbers. I want you to point to each number and tell me what the number is.</p> <p><i>Point to the first number and say:</i> Start here.</p> <p><i>If the child stops on a number for a while, tell the child what the number is, record '3', No attempt, point to the next number and say:</i> What is this number?</p> <p><i>If the child does not attempt 2 consecutive numbers, record '3', No attempt, for remaining numbers and say:</i> Thank you. That is ok.</p>	<p>9 CORRECT 1 INCORRECT 2 NO ATTEMPT..... 3</p> <p>12 CORRECT 1 INCORRECT 2 NO ATTEMPT..... 3</p> <p>30 CORRECT 1 INCORRECT 2 NO ATTEMPT..... 3</p> <p>48 CORRECT 1 INCORRECT 2 NO ATTEMPT..... 3</p> <p>74 CORRECT 1 INCORRECT 2 NO ATTEMPT..... 3</p> <p>731 CORRECT 1 INCORRECT 2 NO ATTEMPT..... 3</p>	
<p>FL23A. Check FL23: Did the child correctly identify two of the first three numbers (9, 12 and 30)?</p>	<p>YES, AT LEAST TWO CORRECT 1 NO, AT LEAST 2 INCORRECT OR WITH NO ATTEMPT 2</p>	<p>2 ⇒FL27A</p>
<p>FL24. Turn the page so the child is looking at the first pair of numbers. Make sure the child is looking at this page. Say: Look at these numbers. Tell me which one is bigger.</p> <p><i>Record the child's answer before turning the page in the book and repeating the question for the next pair of numbers.</i></p> <p><i>If the child does not provide a response after a few seconds, repeat the question. If the child seems unable to provide an answer after repeating the question, record '3', No attempt, for the appropriate pair of numbers. Turn the booklet page and show the child the next pair of numbers.</i></p> <p><i>If the child does not attempt 2 consecutive pairs, record '3', No attempt, for remaining pairs and say:</i> Thank you. That is ok. We will go to the next activity.</p>	<p>7 & 5 CORRECT (7)..... 1 INCORRECT 2 NO ATTEMPT..... 3</p> <p>11 & 24 CORRECT (24)..... 1 INCORRECT 2 NO ATTEMPT..... 3</p> <p>58 & 49 CORRECT (58)..... 1 INCORRECT 2 NO ATTEMPT..... 3</p> <p>65 & 67 CORRECT (67)..... 1 INCORRECT 2 NO ATTEMPT..... 3</p> <p>146 & 154 CORRECT (154)..... 1 INCORRECT 2 NO ATTEMPT..... 3</p>	

<p>FL25. Give the child a pencil and paper. Turn the page so the child is looking at the first addition. Make sure the child is looking at this page. Say: Look at this sum. How much is (number plus number)? Tell me the answer. You can use the pencil and paper if it helps you.</p> <p><i>Record the child's answer before turning the page in the book and repeating the question for the next sum.</i></p> <p><i>If the child does not provide a response after a few seconds, repeat the question. If the child seems unable to provide an answer after repeating the question, record '3', No attempt, for the appropriate sum. Turn the booklet page and show the child the next addition.</i></p> <p><i>If the child does not attempt 2 consecutive pairs, record '3', No attempt, for remaining sums and say: Thank you. That is ok. We will go to the next activity.</i></p>	<p>3 + 2 CORRECT (5)..... 1 INCORRECT 2 NO ATTEMPT..... 3</p> <p>8 + 6 CORRECT (14)..... 1 INCORRECT 2 NO ATTEMPT..... 3</p> <p>7 + 3 CORRECT (10)..... 1 INCORRECT 2 NO ATTEMPT..... 3</p> <p>13 + 6 CORRECT (19)..... 1 INCORRECT 2 NO ATTEMPT..... 3</p> <p>12 + 24 CORRECT (36)..... 1 INCORRECT 2 NO ATTEMPT 3</p>	
<p>FL26. Turn to the first practice sheet for pattern recognition. Say: Here are some numbers. 1, 2, __, and 4.</p> <p><i>Point to each number and blank space and say: What number goes here?</i></p>	<p>CORRECT (3)..... 1 INCORRECT 2 NO ATTEMPT..... 3</p>	<p>2 ⇨FL26B 3 ⇨FL26B</p>
<p>FL26A. That's correct, 3. Let's do another one.</p>		<p>⇨FL26C</p>
<p>FL26B. Do not explain how to get the correct answer. Just say: The number 3 goes here. Say the numbers with me. (<i>Point to each number</i>) 1, 2, 3, 4. 3 goes here. Let's do another one.</p>		
<p>FL26C. Here are some more numbers. 5, 10, 15 and __.</p> <p><i>Point to each number and blank space and say: What number goes here?</i></p>	<p>CORRECT (20)..... 1 INCORRECT 2 NO ATTEMPT..... 3</p>	<p>2 ⇨FL26E 3 ⇨FL26E</p>
<p>FL26D. That's correct, 20.</p>		<p>⇨FL27</p>
<p>FL26E. Do not explain how to get the correct answer. Just say: The number 20 goes here. Say the numbers with me. (<i>Point to each number</i>) 5, 10, 15, 20. 20 goes here.</p>		
<p>FL26F. Check FL26: Was the answer correct?</p>	<p>YES, FL26=1 1 NO, FL26=2 OR 3 2</p>	<p>2 ⇨FL27A</p>

<p>FL27. Now I want you to try this on your own.</p> <p>Here are some more numbers. Tell me what number goes here (pointing to the missing number).</p> <p><i>Record the child's answer before turning the page in the book and repeating the question.</i></p> <p><i>If the child does not provide a response after a few seconds, repeat the question. If the child seems unable to provide an answer after repeating the question, record '3', No attempt, for the appropriate question. Turn the page and show the child the next question.</i></p> <p><i>If the child does not attempt 2 consecutive patterns, record '3', No attempt, for remaining patterns and say:</i> Thank you. That is ok.</p>	<p>5, 6, 7, __ CORRECT (8)..... 1 INCORRECT 2 NO ATTEMPT..... 3</p> <p>14, 15, __, 17 CORRECT (16)..... 1 INCORRECT 2 NO ATTEMPT..... 3</p> <p>20, __, 40, 50 CORRECT (30)..... 1 INCORRECT 2 NO ATTEMPT..... 3</p> <p>2, 4, 6, __ CORRECT (8)..... 1 INCORRECT 2 NO ATTEMPT..... 3</p> <p>5, 8, 11, __ CORRECT (14)..... 1 INCORRECT 2 NO ATTEMPT..... 3</p>	
<p>FL27A. That was my last question. I really enjoyed talking to you. It was very nice of you to help us out. Thank you very much.</p> <p><i>If you are asked by the child or the mother/caretaker how well the child has done, praise the child for effort but do not comment on performance. You may say:</i></p> <p>I am not trained to tell you how (you have/your child has) performed but (your/his/her) participation will help the authorities understand how much children are learning in Trinidad & Tobago.</p>

FS15C. Thank you for your participation.

The Central Statistical Office will be conducting a phone survey about the situation of children, families and households in the future. We would like to invite you to participate in this survey. If you agree to participate, we will ask you to share a phone number we can reach you at and convenient times to contact you. The phone interview will take about 15 minutes, and we may call you a few times over a period of a few months. Participation in this phone survey is voluntary, and even if you agree to participate now, you may decide to withdraw from participation in the future. There will be no costs to you for participating in the phone survey. Please know that all the information you share during future phone interviews will remain strictly confidential, and your phone number will not be shared with anyone outside our team. Would you like to participate?

YES1 NO2	2 ⇒ FS16
